OIL COOLER ROLL FILTER

When your chiller is running, it can collect dust and other air borne particles that can clog your chiller especially in hot and high-humidity conditions. With Daikin's roll filter, your chiller is protected from dust particles, oil mist, and other small particles that can enter the unit. A mix of polyester, rayon, and vinyl materials make the filter fireproof and safe for machine tool applications.

Reasons that your chiller can malfunction:

- Clogged condenser
- Not enough airflow
- Running in overload

Daikin's roll filters are easy install and requires little maintenance. Rolls comes with magnets on the back which sticks to your chiller. Just roll down the filter and snap in place. When its time to change, simply cut away the used roll and roll down a new section.

Your oil cooler is an integral part of your machine. By keeping up with regular maintenance, you can avoid costly repairs.
