**INCL. PULLEYS
AND BUSHES**

TECHNICAL MANUAL

V-BELT DRIVES

This technical manual contains all important technical information and methods for the design and calculation of drives with OPTIBELT V-belts and V-grooved pulleys for industrial applications.

Our Application Technology experts offer you free support service regarding the application of our products and also help solve your drive problems. Especially regarding large volume you should make use of this service.

We offer you the optimum solution using state-of-the-art programmes, the CAP drive calculation software.

PRODUCT DESCRIPTION

optibelt RED POWER 3 HIGH PERFORMANCE WEDGE BELTS

Structure

optibelt RED POWER 3 wedge belts:

The tension cord consists of a special polyester cord. Due to the special processing of the tension cord the optibelt RED POWER 3 wedge belt is very low-stretch and maintenance-free, so that re-tensioning is not necessary.

The transverse fibre mixture on top of and under the tension cord guarantees a high dynamic load of the belt and ensures great flexibility. The cover fabric is highly flexible and abrasion-proof.

Properties

The optibelt RED POWER 3 is maintenance-free due to the high quality components and the special production method. The production processes are continuously monitored using state-of-the-art static and dynamic testing devices. The optibelt RED POWER 3 is suitable for the application in drives with idler pulleys due to its special construction.

The RED POWER 3 has the following properties:

- Maintenance-free
- Powerful
- Cost-effective
- S=C plus usable in sets
- Environmentally friendly
- Electrically conductive according to ISO 1813
- Oil-resistant
- Heat-resistant
- Dust-protected as standard

On request with acceptance test certificate according to EN 1020 "3.1.B".

V-Belt tensioning

For the initial installation of optibelt RED POWER 3 V-belts, the same methods are used as for standard OPTIBELT V-belts. The tension values are to be calculated on the same basis or to be taken from the table on page 138. Once correctly tensioned optibelt RED POWER 3 V-belts need no re-tensioning.

Application areas

optibelt RED POWER 3 wedge belts were especially developed for mechanical engineering. The application areas include compressors, pumps, presses, fans and other heavy duty drives.

Standardisation/Dimensions

optibelt RED POWER 3 wedge belts in the profiles SPZ, SPA, SPB, SPC, 3V/9N, 5V/15N and 8V/25N are standardised according to DIN 7753 Part 1, ISO 4184 and RMA/MPTA.

Table 1

Profile		SPZ	SPA	SPB	SPC

PRODUCT DESCRIPTION

optibelt **BLUE POWER** HIGH PERFORMANCE WEDGE BELTS

Structure/Properties

optibelt BLUE POWER wedge belts:

The aramid tension cord has extremely low-stretch compared to common materials such as polyester. The breaking strength is almost twice as high with the same cord diameter. Nevertheless, the fibre is extremely flexible. The high quality specially prepared aramid tension cord is embedded in a rubber compound. It is supported by the top and bottom structures. These consist of a polychloroprene rubber compound with transverse fibres. The abrasion-proof cover fabric is coated with a special rubber compound and covers the whole belt. The V-belt is electrically conductive according to ISO 1813

optibelt BLUE POWER belts are mainly used when

- highest power transmission levels are required
- there are limited design dimensions
- there is only little installation and tensioning space
- high temperature influences occur

This way, a much better performance is guaranteed e. g. with the same number of belts. Even the operation of once critical drives is now largely free of risk. Higher load limits are now safety zones. Thus optibelt BLUE POWER belts are mainly implemented in heavily loaded drives:

- in critical drives in mechanical engineering
- in special machines
- in agricultural machinery

Application

Attention: When retro-fitting existing drives please let OPTIBELT check the tension. As part of this description not all criteria can be dealt with. Please consult our Application Engineering Department.

Standardisation/Dimensions

optibelt BLUE POWER wedge belts in the profiles SPZ, SPA, SPB, SPC, 3V/9N, 5V/15N and 8V/25N are standardised according to DIN 7753 Part 1, ISO 4184 and RMA/MPTA.

Table 3

* $v > 50$ m/s. Please consult our Application Engineering Department.

PRODUCT DESCRIPTION

optibelt SK HIGH PERFORMANCE WEDGE BELTS

DIN 7753 PART 1 / ISO 4184

Structure

optibelt SK wedge belts consist of:

The polyester tension cord is standard for all profiles and cross sections, with cord constructions matching the requirements of each profile. The cord is specially impregnated and then embedded in a special rubber compound homogeneously bonding with the base and the core.

Due to special processing, the optibelt SK wedge belt is extremely low-stretch. Thus we were able to reduce our recommendation values for minimum axial distance significantly – even dropping below the DIN/ISO requirements. The fabric cover is treated with a wear-resistant rubber compound. This makes the belt resistant to oil, hot and cold temperatures and to the effects of dust.

Properties

The use of the best materials and the most advanced production methods result in this high performance drive element, the optibelt SK wedge belt. The production processes are continuously monitored using state-of-the-art static and dynamic testing devices.

optibelt SK high power wedge belts exceed classic V-belts according to DIN 2215 thanks to the following characteristics:

- Substantially lower width compared to classic V-belt drives that have the same power rating (height to width ratio of approximately 1:1.2). Due to the available space gained by this, the costs for a complete drive with optibelt SK high performance wedge belts are lower than a design with DIN 2215 V-belts.
- Bigger friction surface lowers the centrifugal force and permits belt speeds of up to 42 m/sec.
- Much more elastic, therefore bigger flex rate allowed.
- Little deformation of the belt cross-section when running in grooves, therefore balanced pressure on the belt edges.

These characteristics allow for a significantly better performance than V-belts DIN 2212 with approximately the same top widths. Therefore, we recommend equipping all new drives with optibelt SK wedge belts.

Applications

optibelt SK wedge belts in the profiles SPZ, SPA, SPB and SPC were specially developed for all industrial applications from lightly loaded drives, such as those for pumps, up to heavily loaded mills and even stone crusher drives.

Standardisation/Dimensions

optibelt SK wedge belts SPZ, SPA, SPB and SPC comply with the standards of DIN 7753 and ISO 4184.

The ISO standards specify the datum width as a basis for the standardisation of V-belts and grooves.

The staggering of the datum lengths is implemented according to DIN 7753 Part 1 corresponding to the standard number sequence R 40. In exceptional cases also corresponding to standard number sequence R 20.

For many years, our product range has comprised serial production datum lengths of standard number sequence R 40 and beyond.

Note: Electrically conductive according to ISO 1813.

Table 5

Profile		SPZ	SPA	SPB	SPC
Belt top width	$b_o \approx$	9.7	12.7	16.3	22

* $v > 42$ m/s. Please consult our Application Engineering Department.

PRODUCT DESCRIPTION

optibelt SK WEDGE BELTS

USA STANDARD RMA/MPTA

Structure/Properties

optibelt SK wedge belts according to USA standard RMA/MPTA have the same structure and properties as wedge belts according to DIN 7753 Part 1.

Standardisation/Dimensions

The three wedge belt profiles standardised in the USA are 3V/9N, 5V/15N and 8V/25N. The cross section dimensions of these belts and the according length only partially conform to the profiles and lengths of the wedge belts DIN 7753 Part 1.

The profile 3V/9N roughly corresponds to SPZ; and 5V/15N to profile SPB. There is no comparable DIN/ISO wedge belt profile for 8V/25N. It is possible to use belts in profile 3V/9N and 5V/15N in SPZ-Z/10 or SPB-B/17 pulleys, respectively; but the use of SPZ or SPB belts in RMA/MPTA standard pulleys is not generally recommended. The top width of the American pulley grooves is smaller than that of the corresponding DIN/ ISO pulleys. This can cause wear on the upper edges of SPZ and SPB belts and can lead to premature failure.

Due to its cross section, the optibelt SK wedge belt in SPB profile is also suitable for 5V/15N pulleys.

Note: Electrically conductive according to ISO 1813.

Table 6

Profile		3V/9N	5V/15N	8V/25N
Belt top width	$b_o \approx$	9	15	25
Belt height	$h \approx$	8	13	23
Recommended minimum pulley outside diameter	$d_{a\min}$	67	151	315
Belt weight (kg/m)	\approx	0.074	0.195	0.575
Flex rate (s^{-1})	$f_{B\max} \approx$	100		
Belt speed (m/s)	$v_{\max} \approx$	55*		

* > 55 m/s. Please contact our Application Engineering Department.

The belt length designation refers to the effective outside length.

Example:

Inch designation	Metric designation
3V 750	9N 1905
3V = profile 3/8"	9 \approx 9 mm
750 = outside length in inches : 10 (1 inch = 25.4 mm)	N = designation for single V-belt
Outside length in mm:	1905 = effective outside length

$$L_a = \frac{750 \cdot 25.4}{10}$$

$$L_a = 1905 \text{ mm}$$

Applications

The use of optibelt SK wedge belt drives in profiles 3V/9N and 5V/15N is recommended for machines exported to countries such as the USA and Canada where these belt profiles are standardised and predominantly used. Profile 8V/25N is primarily employed in very heavy duty drives such as mills or stone crushers. As these wedge belts transmit very high levels of power, they can sometimes form a more compact drive than the SPC profile.

For this reason, the 8V/25N profile has continued to be used in Europe for such applications. A further advantage is the fact that single wedge belts can be replaced by kraft-bands, without changing the pulley geometry, in case unexpected belt vibration problems develop.

Drive calculation

Drive calculations follow the procedures described in this manual. The power value of the SPZ applies for drives with the 3V/9N profile. The value of the SPB profile applies for 5V/15N. The datum diameters of the SPZ and SPB wedge belts have to be the same as the external diameters of the 3V/9N and 5V/15N. Slight mathematical differences in the rotational frequency and transmission have no practical influence. Slight differences in the theoretical drive speed and the speed ratio are not significant in practice.

PRODUCT DESCRIPTION

optibelt **VB** CLASSIC V-BELTS

DIN 2215 / ISO 4184

Structure/Properties

optibelt VB classic V-belts are manufactured using the same production processes as those for optibelt SK high performance wedge belts.

The components used are perfectly suited to the power ratings P_N . These values are far above those given by DIN 2218. Thus the operational safety in existing drives is increased and overloading is avoided.

- optibelt VB classic V-belts have a height-width ratio of 1:1.6.
- The maximum belt speed $v_{\max} = 30$ m/s should not be exceeded.
- The allowed flexibility rate is far below that of wedge belts. It is $f_{B \max} = 80$ s⁻¹.

Application areas

optibelt VB classic V-belts are mainly employed as replacement parts for industrial drives. For new drives, the use of high performance wedge belts is almost always recommended due to reasons of space and cost. However, special drives such as V-flat drives can often only be operated with classic V-belts. In special constructions, optibelt VB classic V-belts tackle difficult drives in the gardening sector and in agricultural machinery.

For these applications special belt constructions and calculation methods are required which are not included in this manual. In these cases we ask you to give us the according drive data.

Standardisation/Dimensions

optibelt VB classic V-belts in the profiles Y/6, Z/10, A/13, B/17, C/22, D/32 and E/40 are standardised according to DIN 2215 and ISO 4184.

Further, non-standardised ISO profiles 5, 8, 20 and 25 are available. These profiles should however not be used due to reasons of exchangeability and rationalisation.

The ISO standard 4184 specifies the datum length for measuring the belt length. The former belt designation of the inside length L_i is replaced by the datum length L_d . For the conversion factors from pitch to inside length, please see page 161.

Note: Electrically conductive according to ISO 1813.

Table 7

PRODUCT DESCRIPTION

optibelt **KB** KRAFTBANDS

Product characteristics

optibelt KB kraftbands are characterised by the following properties:

- High level of uniform power transmission
- Favourable running behaviour especially regarding vibration
- Excellent flexibility
- High centre distances with small pulley datum diameters
- V-flat drives
- Vertical drives
- Clutched drives and conveyance drives

optibelt KB kraftbands consist of individual V-belts that are connected to one another via a top surface. Depending on the application the kraftbands will be fitted with two, three, four or five ribs.

On special request, kraftbands can also be delivered with more than five ribs.

When using multiple kraftbands per drive, combinations of sets are required.

Order example

The drive is to be equipped with a 5V 1600/15J 4064 kraftband with 18 ribs.

Kraftbands: Installation combination with 5/4/4/5 ribs

The order is as follows:

A KB set, consisting of:

2 pieces optibelt KB kraftbands 4-5V 1600/15J 4064 and

2 pieces optibelt KB kraftbands 5-5V 1600/15J 4064

4 or 5 = quantity of ribs

5V/15J = profile

1600 = belt number or 160 inch belt length

4064 = outside length in mm

Standardisation/Dimensions

KB wedge belts

optibelt KB kraftbands with high power wedge belts are manufactured in SPZ, SPA, SPB, SPC profiles as well as in 3V/9J, 5V/15J, 8V/25J in compliance with international conventions.

SPZ, SPA, SPB and SPC kraftbands can be used with V-grooved pulleys according to DIN 2211 and ISO 4183. 3V/9J, 5V/15J, 8V/25J kraftbands can be used with V-grooved pulleys according to ISO 5290 and USA standard RMA/MPTA IP 22.

KB classic V-belts

optibelt KB kraftbands with classic V-belts are manufactured in AJ/HA, BJ/HB, CJ/HC, DJ/HD profiles in compliance with international conventions.

The ISO 5291 standard and the RMA/MPTA IP 20 USA standard are applied to kraftbands in machine construction. The ASAE S211. ... USA standard is applied to kraftbands used in agricultural machine construction.

Note: Electrically conductive according to ISO 1813.

PRODUCT DESCRIPTION

optibelt **KB** KRAFTBANDS

Product design

The optibelt KB kraftbands are used in the most varied constructions according to the technical requirements and applications.

Wrapped kraftbands

- 1 Top surface
- 2 Rubber coating
- 3 Polyester tension cord
- 4 Base compound
- 5 Cover fabric

Profiles

3V/9J; 5V/15J; 8V/25J;
SPZ; SPA; SPB; SPC;
A/HA; B/HB; C/HC; D/HD

Dimensions

1200 mm to 12,000 mm
standard range

Application areas:

OPTIBELT wrapped KB kraftbands are primarily used in mechanical engineering and agricultural machines.

RED POWER 3 high performance kraftbands – wrapped

- 1 Top surface
- 2 Transverse polychloroprene fibre compound
- 3 Polyester tension cord, maintenance-free
- 4 Transverse polychloroprene fibre compound
- 5 Base compound
- 6 Abrasion-resistant cover fabric

Profiles

3V/9J; 5V/15J; 8V/25J;
SPB; SPC

Dimensions

1200 to 12,000 mm
standard range

Application areas

This compact drive element is primarily used for special problem solutions in mechanical engineering and commercial vehicle construction.

We recommend the use of optibelt KB RED POWER 3 for maintenance-free drives and for the use with back bend tension idlers.

PRODUCT DESCRIPTION

optibelt **KB** KRAFTBANDS

High performance kraftbands – raw edge SUPER KBX-POWER

- 1 Top surface
- 2 Upper belt structure
- 3 Polyester tension cord, low maintenance
- 4 Embedding compound
- 5 Belt base
- 6 Moulded cogs

Profiles

3VX/9JX; 5VX/15JX;
XPB
XPZ; XPA on request

Dimensions

1270 mm to 3556 mm
standard range

Application areas

The use of SUPER KBX-POWER kraftbands is recommended when dealing with compact drive solutions with high power requirements, small pulley datum diameters and for many more special applications in mechanical engineering and vehicle construction.

Kraftbands with aramid cord – wrapped and raw edge

- 1 Top surface
- 2 Upper belt structure
- 3 Aramid tension cord, low maintenance
- 4 Embedding compound
- 5 Belt base
- 6 Moulded cogs

Profiles

3V/9J; 5V/15J; 8V/25J;
SPB; SPC; 5VX/15JX;
A/HA; B/HB; C/HC

Dimensions

1270 mm up to 12,000 mm wrapped kraftbands
1270 mm up to 3556 mm raw edge kraftbands
standard range

Application areas

The advantages of the optibelt KB kraftbands with aramid tension cords become obvious when dealing with heavy loaded drives in mechanical engineering and in the agricultural machine industry. These kraftbands provide the highest possible level of reliability wherever high temperature impacts and low adjustment ranges are present.

PRODUCT DESCRIPTION

optibelt **KB** KRAFTBANDS

Kraftbands with top coatings

- 1 PKR top surface
- 2 Rubber coating
- 3 Polyester tension cord
- 4 Rubber core
- 5 Cover fabric

Kraftband
with PKR 0 coating

Kraftband
with PKR 1 coating

Kraftband
with PKR 2 coating

Kraftband
with PKR 3 coating

Application areas

When dealing with conveyance applications, the optibelt KB kraftbands can be provided with an additional coating.

With patterned top surfaces, these kraftbands are suitable for the conveyance of containers, heavy cargo and for diverse transport and shipment equipment.

Further details see chapter "Conveyor elements".

Drive calculation

Drives with optibelt KB kraftbands in mechanical engineering have to be designed according to the stated drive calculation example found on pages 85 to 87 in this manual as well as according to the power values for the according products and profiles.

Special power and tension values apply for OPTIBELT kraftbands with aramid constructions. Agricultural machine drives will be dimensioned according to special calculation methods. Therefore we request the submission of the technical data.

PRODUCT DESCRIPTION

optibelt **SUPER X-POWER M=S**

RAW EDGE, MOULDED COGGED – DIN/ISO, RMA/MPTA

Advantages

SUPER X-POWER M=S wedge belts are perfectly suited for applications with

- extremely small pulley diameters
- high rotational speeds
- high and low ambient temperatures

SUPER X-POWER M=S wedge belts offer

- high power transmission
- extremely low stretch
- improved maintenance intervals – low maintenance
- optimised running characteristics – smooth running
- excellent heat and oil resistance
- M=S, for set matching
- electrically conductive according to ISO 1813

Drive ratios $i = 1:12$ are possible with optibelt SUPER X-POWER.

Multi-stage drives can be eliminated.

optibelt SUPER X-POWER M=S wedge belts in profiles XPZ, XPA, XPB, XPC, 3VX/9NX and 5VX/15NX, offer the best technical and economic solutions due to their harmonised premium materials.

Structure/Properties

optibelt SUPER X-POWER M=S consist of:

1. The special polyester tension cord of SUPER X-POWER M=S is extremely low-stretch and allows for maintenance-free drives.

The number of re-tensioning processes is reduced and the drive becomes less expensive in the long term.

2. The structure of the cover fabric supports the tension cord and this is how the SUPER X-POWER M=S achieves its high level of flexibility.

3. The belt base structure consists of a high performance chloroprene compound, reinforced with a traverse fibre compound.

The special tension cord and the optimum tooth shape allow for higher dynamic power transmissions, improved bending stress and a higher temperature resistance.

As high power transmission is possible, even with small pulley diameters and high engine speed, weight and space can be reduced thus also substantially reducing costs.

Application areas Machines:

- compressors
- fans
- compactors
- pumps
- wood working machines
- high performance saws
- special machines

Machine tools:

- lathes and drilling machines
- grinding machines

optibelt SUPER X-POWER M=S V-belts are recommended for mechanical engineering applications wherever wrapped V-belts are likely to reach their performance limits.

PRODUCT DESCRIPTION

optibelt **SUPER X-POWER M=S**

RAW EDGE, MOULDED COGGED – DIN/ISO, RMA/MPTA

Belt tension / Static shaft load

Belt tension and static shaft load are calculated in the same way as for wrapped belts. When dealing with the same geometric ratios, the shaft load does not exceed that of wrapped belts although the quantity of the belts is often less. Therefore, only the individual V-belt requires higher tension than wrapped belts.

The precise edges of the optibelt SUPER X-POWER M=S V-belt ensure uniform seating in the pulley grooves, resulting in smoother running.

Drive calculation

Drive design using optibelt SUPER X-POWER M=S belts should be carried out according to the examples given on pages 85 to 87. The higher power ratings given in the relevant tables, apply. These are based on a theoretical laboratory running time of 25,000 hours.

Standardisation/Dimensions

The cross sections and dimensions of optibelt SUPER X-POWER M=S V-belts are in accordance with DIN 7753 Part 1, DIN 2215, ISO 4184 and RMA/MPTA.

The basis for the length measurement is the datum length (L_d) to DIN/ISO.

Table 8

Profile	Top belt width $b_o \approx$	Datum width b_d	Belt height $h \approx$	Meter weight [kg/m] \approx
XPZ	9.7	8.5	8	0.065

PRODUCT DESCRIPTION

optibelt **SUPER E-POWER M=S**

RAW EDGE, MOULDED COGGED – DIN/ISO, RMA/MPTA

Advantages

SUPER E-POWER M=S wedge belts are perfectly suited for complex applications which require the highest capacities under the most severe conditions such as with

- extremely small pulley diameters
- high rotational speeds
- high and low ambient temperatures

SUPER E-POWER M=S wedge belts offer

- high power transmission, up to 20 % better performance
- extremely high capacity and extremely low stretch
- optimised extremely smooth running characteristics
- optimised operational life and operating times
- improved maintenance intervals and low service expenditures (low maintenance)
- excellent temperature resistance from -50 °C to +120 °C
- M=S, for set matching
- electrically conductive according to ISO 1813 and compatible with ATEX

Structure/Properties

optibelt SUPER E-POWER M=S consist of:

1. The highly modular polyester tension cord of the SUPER E-POWER M=S is very low-stretch and thus allows for a low maintenance drive. The number of re-tensionings is reduced; the drive is more cost-effective in the long term.

2. The structure of the cover fabric supports the tension cord and this is how the SUPER E-POWER M=S achieves its high level of flexibility.

3. The belt base structure consists of a high performance EPDM compound, reinforced with a traverse fibre compound. The special tension cord and the optimised rubber compound allow for a higher power transmission level, less flexing stress and better heat dissipation.

optibelt **SUPER E-POWER M=S**

The use of the SUPER E-POWER M=S by OPTIBELT allows for high power transmissions even with small pulley diameters and high engine speed. Thus, weight and space can be reduced, also additionally reducing costs.

Application areas Machines:

- compressors
- fans
- compactors
- pumps
- wood working machines
- high performance saws
- special machines

Machine tools:

- lathes and drilling machines
- grinding machines

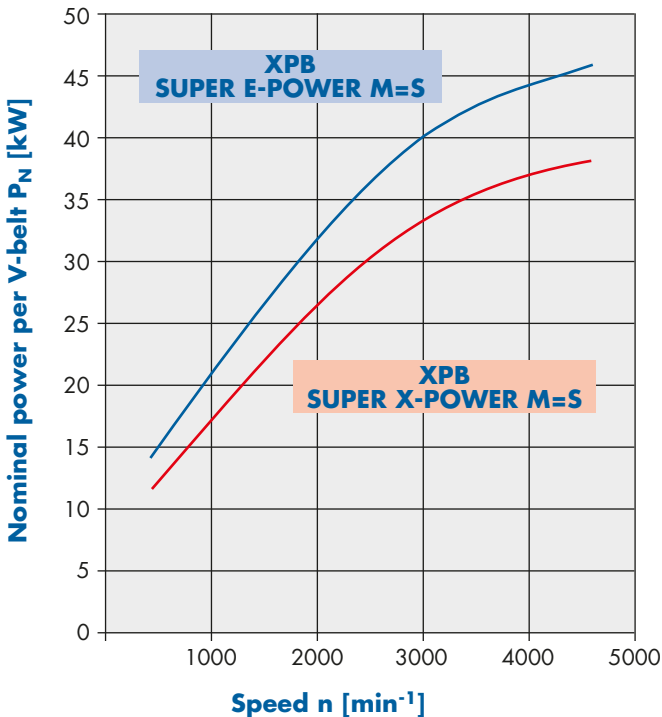

In mechanical engineering, wrapped V-belts are often employed in fringe areas and might wear out soon. In order to prevent downtimes, we recommend using optibelt SUPER E-POWER M=S.

SUPER E-POWER
available on request

PRODUCT DESCRIPTION

optibelt **SUPER E-POWER M=S**

RAW EDGE, MOULDED COGGED – DIN/ISO, RMA/MPTA

Belt tension / Static shaft load

Belt tension and static shaft load are calculated the same way as for wrapped belts. When dealing with the same geometric ratios, the shaft load does not exceed that of wrapped belts although the quantity of the belts is often less. Therefore, only the individual V-belt requires higher tension than wrapped belts.

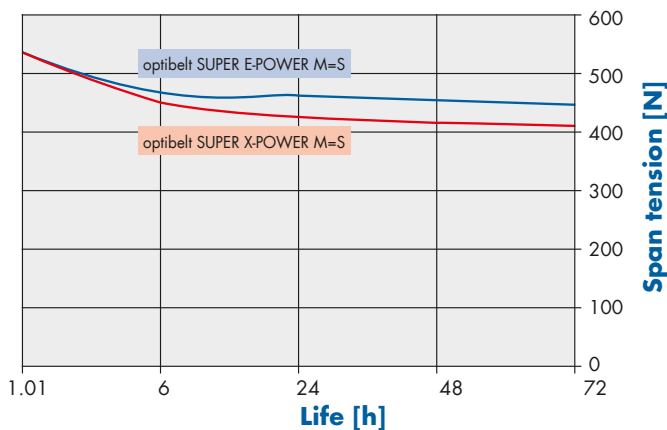

The precise edges of the optibelt SUPER E-POWER M=S V-belt ensure uniform seating in the pulley grooves, resulting in smoother running.

Test results

optibelt SUPER E-POWER M=S exhibit a considerably improved tension retention when compared to the common raw edge, moulded cogged construction.

Comparison test: **Tension retention [N]**,

Power P = 13.0 kW, n₁ = 4700 min⁻¹

Drive calculation

Drive design using optibelt SUPER E-POWER M=S belts should be carried out according to the examples given on pages 85 to 87. The higher power ratings given in the relevant tables, apply. These are based on a theoretical laboratory running time of 25,000 hours.

Standardisation/Dimensions

The cross sections and dimensions of optibelt SUPER E-POWER M=S V-belts are in accordance with DIN 7753 Part 1, DIN 2215, ISO 4184 and RMA/MPTA.

The basis for the length measurement is the datum length (L_d) to DIN/ISO.

PRODUCT DESCRIPTION

optibelt **SUPER TX M=S** V-BELTS

RAW EDGE, MOULDED COGGED – DIN/ISO, RMA/MPTA

The advantages of optibelt SUPER TX M=S V-belts can best be seen when dealing with

- extremely small pulley diameters
- high rotational speeds
- extremely high power requirements
- higher ambient temperatures

In these cases the use of wrapped V-belts is uneconomic and not recommended.

optibelt SUPER TX M=S V-belts in profiles ZX/X10, AX/X13, BX/X17 and CX/X22 offer the best technical and economic solutions under these conditions due to their high quality perfectly harmonised materials.

Structure/Properties

optibelt SUPER TX M=S consist of:

The belt base consists of a polychloroprene rubber compound with traverse fibres which support the tension cord.

This results in

- significant flexing rate
- extreme traverse stability
- significantly improved wear resistance and slip resistance
- electrically conductive according to DIN 1813
- low stretch

The specially prepared tension cord is embedded in a special compound. Even with high dynamic loads a perfect adhesion between all components is assured. The fabric layers of the upper structure support the tension cord. The fibre-reinforced substructure combined with the OPTIBELT tension cord and the moulded cogs allows for a higher dynamic power transmission. The moulded cogs decrease the flexing resistance, resulting in an excellent flexing rate. Thus, much smaller pulleys can be used compared to common wrapped V-belts.

optibelt SUPER TX M=S allows for drive ratios $i = 1:12$. Multi-stage drives can be eliminated.

Due to the use of high quality polychloroprene rubber compounds, the optibelt SUPER TX M=S has a higher oil and heat-resistance than wrapped V-belts.

As high power transmission is possible, even with small pulley diameters and high engine speed, weight and space can be reduced thus also substantially reducing costs.

Drive calculation

Drive design using optibelt SUPER E-POWER M=S belts should be carried out according to the examples given on pages 85 to 87. The higher power ratings given in the relevant tables, apply. These are based on a theoretical laboratory running time of 25,000 hours.

V-grooved pulleys

optibelt SUPER TX M=S are used with pulleys to DIN 2211, DIN 2217, ISO 4183 and RMA/MPTA. Considerably smaller minimum pulley datum diameters are allowed.

PRODUCT DESCRIPTION

optibelt **VARIO POWER** VARIABLE SPEED BELTS

RAW EDGE, MOULDED COGGED / DOUBLE-COGGED – DIN 7719 / ISO 1604

optibelt **VARIO POWER** variable speed belts – raw edge, moulded cogged

Increasing demands on variable speed belts due to the continuous increase of power transmission levels initiated the development of the raw edge, moulded cogged variable speed belts.

The base compound consists of a polychloroprene rubber compound with traverse fibres. The high quality and extremely low-stretch polyester or aramid tension cord is embedded in a rubber compound. It is effectively supported by an upper and substructure. The special characteristics of the raw edge, moulded cogged variable speed belt are:

- high power transmission
- excellent flexibility in running direction
- high traverse stability
- exceptionally smooth running
- wear and slip resistance
- long operational life
- electrically conductive according to ISO 1813

Profiles

Belt widths of up to 100 mm

Belt heights of 5-25 mm

Dimensions

Lengths up to 5000 mm

Standardised dimensions to BS/DIN/ISO and USA standard RMA/MPTA

Application areas

Industrial machinery:	special drives
Variable speed drives:	compact units
Printing machinery:	multi-colour offset drives
Gearboxes:	variable diameter pulley sets
Agricultural machinery:	thresher drum drives
Textile machinery:	winding machinery
Machine tools:	lathes
Automotive technology:	snowmobile drives

optibelt **VARIO POWER** variable speed belts – raw edge, double-cogged

Further increases in demand on the performance of drive elements and the trend towards designing ever smaller, space saving drive units, led to the development of the double-cogged, raw edge optibelt **VARIO POWER** variable speed belt.

Double-cogged OPTIBELT variable speed belts allow for the smallest pulley diameters, even below standard recommendations. The double-cogged design improves heat emission, thereby significantly reducing the belt running temperature. The production methods and the structure of the belt have been derived from the raw edge **VARIO POWER** variable speed belt. Depending upon the application and application range, this belt can also be equipped with layers of special cross-cord material in the base compound. The belt is double-cogged, with the depth and spacing of the cogs matching with the specific belt profile. The polyester or aramid tension cord ensures ideal power transmission, increased service life, and extremely low-stretch characteristics.

The features of the **VARIO POWER** variable speed belt can be summarised as follows:

- extremely high acceptance of axial loads
- high flexibility and flexing rate
- better heat emission
- use with small pulley diameters
- high running smoothness with high belt speeds
- long operational life
- electrically conductive according to ISO 1813

Profiles

Belt widths of 20-85 mm

Belt heights of 10-30 mm

Dimensions

Length ranges from 600-3500 mm

Profiles and dimensions following DIN/ISO and USA standard RMA/MPTA

optibelt **VS** variable speed belts – wrapped

The optibelt **VS** is the first generation of variable speed belts. Its structure complies with the standard constructions of wrapped, classic V-belts or wedge belts.

Profiles and dimensions: on request

PRODUCT DESCRIPTION

optibelt DK DOUBLE-SIDED V-BELTS

Structure

A cross section of the optibelt DK double-sided V-belt reveals a hexagon made up of two congruent trapeziums. The neutral axis containing the tension cord is exactly half way up the belt profile. optibelt DK double-sided V-belts comprise:

Properties/Application areas

The tension cord positioned at the centre of the belt gives the optibelt DK double-sided V-belts extreme flexibility and low-stretch properties. Thus, the belt is particularly suitable for flexing in different directions in the same plane. optibelt DK double-sided V-belts are used when several pulleys are arranged in one plane and the direction of one or more of the driven pulleys has to be changed without crossing the belts. Due to the position of the tension cord in the neutral axis and the special shape of the double-sided V-belt, the tension cord is not subjected to any force other than tension unlike standard V-belts bent around an outside idler. The optibelt DK double-sided V-belt comes up to typical serpentine arrangements. Special constructions with different top surfaces are possible. Mainly, double-sided V-belts are used in agricultural machinery but also in mechanical engineering.

Standardisation

The cross dimensions of the optibelt DK double-sided V-belts comply with DIN 7722 and ISO 5289.

Table 13

Profile	DIN/ISO designation	HAA	HBB	HCC	HDD	—	—
	Designation	AA	BB	CC	DD	22x22	25x22
Belt width	$b \approx$	13	17	22	32	22	25
Belt height	$h \approx$	10	13	17	25	22	22
Recommended minimum pulley diameter	$d_{a \min}$	80	125	224	355	280	280
Belt weight [kg/m]	\approx	0.150	0.250	0.440	0.935	0.511	0.625
Belt speed [m/s]	$v_{\max} \approx$	30					

This applies to the profiles HAA, HBB, HCC and HDD, in accordance with the USA standard ASAE S 211. ..., thereby ensuring an international interchange. The reference/nominal length of the optibelt DK double-sided V-belt is measured on the effective/outside diameter of the measuring pulley. This length equates to the middle length of the belt.

Conversion factors are as follows:

Profile AA/HAA reference length \approx centre length – 4 mm

Profile BB/HBB reference length \approx centre length – 8 mm

Profile CC/HCC reference length \approx centre length + 3 mm

Profile DD/HDD reference length = centre length.

Experience has shown that in practical use/ordering these conversion factors can be ignored.

Note: Electrically conductive according to ISO 1813.

V-grooved pulleys

No special pulleys are required for optibelt DK double-sided V-belts. Pulleys conforming to ISO 4183, DIN 2211, DIN 2217 and ASAE S 211. ... are suitable.

Profile AA/HAA in grooved pulleys for profile A/13-SPA

Profile BB/HBB in grooved pulleys for profile B/17-SPB

Profile CC/HCC in grooved pulleys for profile C/22-SPC

Profile DD/HDD in grooved pulleys for profile D/32

Special profiles

For special applications, we also supply double-sided V-belts in profiles 22 x 22 and 25 x 22. These are not standardised.

Drive calculation

Drive calculations for optibelt DK double-sided V-belts differ from those given in this manual for two pulley drives. Multi pulley calculations are so complicated that they cannot be presented here.

Reference lengths, rotational speeds, transmission ratios and belt speeds are determined by the reference/outside pulley diameters.

Our Application Engineering Department will be pleased to assist you in the design of drives using optibelt DK double-sided V-belts.

STANDARD PROPERTIES

According to the respective requirements, all OPTIBELT V-belts are manufactured using carefully selected basic materials and continuously updated technical procedures. Regular routine checks during production, elaborate laboratory tests and careful testing of the raw materials used guarantees a consistently high level of quality that can be expected from every OPTIBELT drive element. Reliability and long service life are considered the most important criteria.

Oil resistance

The limited oil resistance prevents the damaging effects of mineral oils and greases, as long as these substances

are not in permanent contact with the timing belt and/or are not present in large quantities. Animal and vegetable fats as well as water-soluble cooling and cutting oils result in a reduction of the service life. For higher concentrations, we recommend the use of our SUPER X-POWER M=S or the special design "05", respectively.

Heat resistance

Standard V-belts allow ambient temperatures of up to +70° C. Temperatures exceeding this range lead to

premature ageing and hardening of V-belts. In such cases, we recommend the use of our special constructions RED POWER 3 or SUPER E-POWER or SUPER X-POWER. For details see page 23.

Dust protection

Dust enormously reduces the service life of V-belts. Wear-resistant fabric covers make OPTIBELT V-belts resistant

to dust. This is demonstrated by their continuous application in cement factories, mills, in the stone processing industries, and in the mining industry.

M=S "Matched Sets"

optibelt SUPER E-POWER M=S, optibelt X-POWER M=S and optibelt SUPER TX M=S are raw edge, mould-

ed cogged V-belts that can be used in sets without measuring. Due to special production processes the narrowest tolerances can be achieved so that V-belts of a given nominal length can be combined without further measurement. The precise edging of the belt results in smooth running. The even power transmission of all belts ensures a high efficiency and saves energy.

Set code numbers are not necessary, there is no set bundling. As a consequence, storage and costs can be reduced.

S=C plus "SetConstant"

This stands for wrapped V-belts that can be used in a set without measuring.

And here are the advantages:

- + saves energy, efficiency of up to 97 %
- + consistent power transmission
- + incorporates the world famous S=C plus tolerances: always at nominal length
- + extremely low-stretch
- + longer service life
- + set code numbers are not required
- + reduces vibrations with resultant smooth running
- + requires only minimal adjustment space
- + reduces self-heating, thus ageing resistant
- + longer maintenance intervals
- + simple storage
- + significant cost reductions

Example of S=C plus length tolerances for a high performance wedge belt with 5000 mm datum length:

The dimension (A) is the tolerance allowed according to DIN of an individual V-belt with a length of 5000 mm. If you want to install sets for multi-groove drives, the individual elements in a set should not deviate more than 6 mm (B). The tolerance of the optibelt S=C plus V-belt is considerably lower than those allowed according to the standard. S=C plus tolerances are always at nominal length.

SPECIAL CONSTRUCTIONS

Extra heat-resistant V-belts

The service life of standard OPTIBELT V-belts can be massively reduced due to the effects of temperature. In case of ambient temperatures that constantly vary between +70 °C and 90 °C we recommend RED POWER 3, SUPER E-POWER M=S, SUPER X-POWER M=S or SUPER TX M=S belts. Special rubber compounds largely prevent premature ageing and brittleness. In borderline cases, trials are recommended, as individual drive parameters such as belt speed and pulley diameter may influence the operational life.

The diagram below illustrates the great impact of ambient temperature on the operational life of belts. It also presents the optimised operational life of special constructions in high temperature ranges compared to standard constructions. However, you cannot expect the same service life as under normal conditions.

Smooth running selected V-belts

Drives that require a smooth running – that is variations of shaft centre distances – such as lathes and grinders, and are supposed to guarantee a vibration free operation, should be equipped with OPTIBELT V-belts with “selected smooth running”. Fluctuations in the shaft centre distance are electronically measured on testing machines. The measurements comply with the OPTIBELT standards or the conditions agreed upon with our customers.

Mining industry

optibelt SK wedge belts and optibelt VB classic V-belts can be used in underground mining as well as in areas above ground that are exposed to explosion and fire risks. For these areas, different national and international testing specifications and standards apply. OPTIBELT “Mining Belts” comply with all requirements of “DIN 22100-7”

Applications with other special constructions

For special applications e.g. in general mechanical engineering, agricultural machinery and horticulture, further special constructions are also available in intermediate sizes for

- special drives with tension, back bend and guide idlers
- clutching drives
- shock loads
- extreme operating conditions

These OPTIBELT V-belts in special constructions have different tension cord types and structures with a variety of rubber compounds, different fabric qualities and a differing number of fabric covers and top surfaces.

All special constructions and intermediate lengths must be ordered in sets or in multiples thereof.

As part of this description not all criteria can be dealt with. For further information please contact our Application Engineering Department.

Maximum production length: 10000 mm L_i
 Non-standard length ranges from 1800 mm
 Minimum order quantity for special length ranges from: 1200 to 2000 mm
 6 pieces with 5 ribs or 8 pieces with 4 ribs or 10 pieces with 3 ribs or 16 pieces with 2 ribs or a multiple thereof
 2001 to 8000 mm
 6 pieces with 5 ribs or 8 pieces with 4 ribs or 11 pieces with 3 ribs or 16 pieces with 2 ribs or a multiple thereof
 Weight: per rib \approx 0.163 kg/m
 Minimum order quantity for design with aramid tension cord on request

Maximum production length: 18000 mm L_i
 Non-standard length ranges from 1800 mm
 Minimum order quantity for special length ranges from: 5 pieces with 5 ribs or 6 pieces with 4 ribs or 9 pieces with 3 ribs or 13 pieces with 2 ribs or a multiple thereof
 Weight: per rib \approx 0.266 kg/m
 Minimum order quantity for design with aramid tension cord on request

Maximum production length: 18000 mm L_i
 Non-standard length ranges from 2286 mm
 Minimum order quantity for special length ranges from: 2286 to 10000 mm
 4 pieces with 5 ribs or 5 pieces with 4 ribs or 6 pieces with 3 ribs or 10 pieces with 2 ribs or a multiple thereof
 10001 to 12000 mm
 3 pieces with 5 ribs or 4 pieces with 4 ribs or 5 pieces with 3 ribs or 8 pieces with 2 ribs or a multiple thereof
 Weight: per rib \approx 0.447 kg/m
 Minimum order quantity for design with aramid tension cord on request

Maximum production length: 18000 mm L_i
 Non-standard length ranges from 2500 mm
 Minimum order quantity for all sizes:
 2 pieces with 5 ribs or 2 pieces with 4 ribs or 3 pieces with 3 ribs or 5 pieces with 2 ribs or a multiple thereof
 Weight: per rib \approx 0.798 kg/m
 Minimum order quantity for design with aramid tension cord on request

Belt no. x 25.4 = mm + 107 mm
(over belt no. 210)
Belt no. x 25.4 = mm + 56 mm

Profile DD/HDD – (up to belt no. 210)
Belt no. x 25.4 = mm + 132 mm
(over belt no. 210)
Belt no. x 25.4 = mm + 69 mm

PRODUCT DESCRIPTION

optibelt **KS** V-GROOVED PULLEYS – optibelt **TB** TAPER-BUSHES

optibelt KS V-grooved pulleys

optibelt KS V-grooved pulleys are available with pilot bore and for taper bushes in all common belt profiles.

optibelt TB taper bushes

optibelt TB taper bushes are used for easy installations of pulleys on shafts with or without keyway.

PRODUCT DESCRIPTION

optibelt **KS** V-GROOVED PULLEYS, TYPES

Balancing

V-grooved pulleys are statically balanced in accordance with the guidelines in VDI 2060, as standard: Quality level G 16; for dia. $d_d >$ at $n = 1500$ rpm; for dia. $d_d > 400$ mm at $v = 30$ m/s.

The pulleys are balanced without keys on smooth balancing spindles. Machines whose runners are balanced with a keyway in the shaft end should be ordered as follows: "Balanced with pilot bore and empty keyway on smooth balancing spindles without key."

Balancing in one plane to quality level G 6.3 on request. We recommend balancing in two planes according to quality level G 6.3, or finer when $v > 30$ m/s or the ratio of datum diameter to face width $d_d : b_2$ is < 4 at $v > 20$ m/s. In such cases, the operational speed of the pulley must be given.

Special pulleys and customised pulleys on request

PRODUCT DESCRIPTION

optibelt **KS** V-GROOVED PULLEYS – STANDARDS – DESIGN CRITERIA – TYPES

An essential component in V-belt drive systems is the V-belt pulley, or in short V-pulley. They are primarily manufactured from cast iron EN-GJL-200-DIN EN 1561 and are available with a pilot hole, pre-fabricated hole or with a clamping bush system. The DIN standard as well as the most important national pulley standards of all industrial nations are based upon the ISO 4183 standard "Grooved Pulleys for Classic V-Belts and Wedge Belts". V-belt pulleys with grooves for wedge belts according to DIN 7753 Part 1 are also suitable for classic V-belts with the same datum width b_d according to DIN 2215. These are known as dual duty pulleys.

- Balancing in two planes (dynamically), quality level Q 6.3 becomes necessary if:
 1. $v > 30$ m/s or
 2. the ratio of datum diameter to pulley face width $d_d : b_2 < 4$ at $v > 20$ m/s.

Note: The timely replacement of pulleys damaged by corrosion or erosion prevents premature failure of the belts. Furthermore, it is important to prevent the belt basis from direct contact with the groove basis as this can quickly lead to damage and premature failure (exception: special drives such as V-flat drives).

Example

	Belt		Grooved pulleys
Profile	SPZ	Z/10	SPZ – Z/10
Top width	$b_o \approx 9.7$	$b_o \approx 10$	$b_1 \approx 9.7$
Datum width	$b_d = 8.5$		$b_d = 8.5$
Belt height/ groove depth	$h \approx 8$	$h \approx 6$	$t_{min} = 11$

When selecting a pulley, the following criteria should be taken into account:

- Use standard pulley diameters. If design considerations make this impossible, a standard diameter should, as a minimum requirement, be selected for the largest pulley in the drive.
- Do not select a pulley smaller than the recommended size to ensure a longer operational life and overall drive efficiency.
- If manufacturing your own pulleys, the overall shape and processing must conform to the relevant standards.
- Grooved pulleys are generally balanced in one plane (statically) to quality level Q 16 as in VDI 2060.

Deep grooved pulleys

Deep grooved pulleys are employed for special drive situations such as

- the use of guide idlers,
- twist drives or
- drives subject to severe vibration.

The increased groove top width " b_1 " and depth " t " of deep grooved pulleys improves the running characteristics of the belt, particularly when entering the groove. Turning over and running out of the belt are prevented.

Deep grooved pulleys are not suitable for the use with kraftbands.

(values in mm)

For drives with several grooves the total of all deviations from the nominal value e for all groove distances of a pulley ± 0.8 mm must not be exceeded. For further details see USA standard RMA/MPTA.

Note

The allowed variations of V-grooved pulleys according to USA standard RMA/MPTA deviate only slightly from the values contained in ISO 5290 "Grooved pulleys for joint narrow V-belts (Kraftbands)". Therefore, optibelt KB kraftbands can be used in V-grooved pulleys manufactured according to both standards. These V-grooved pulleys are also suitable for optibelt SUPER X-POWER M=S V-belts.

For further details please see standard ISO 5290.

1) Tolerance for the centre distance e of two adjacent grooves.

2) The sum of all deviations from the nominal dimension " e " for all groove distances of a pulley must not exceed the given tolerance.

The international standard ISO 5290 specifies pulley groove dimensions for belt profiles 3V/9J, 5V/15J, 8V/25J.

The groove top width " b_1 " is used as the basic reference dimension for standardisation of the grooves and joint V-belts. The pulley groove and joint V-belts are considered as a single unit in the standard ISO 5290.

The values δh_1 and δh_2 were chosen to ensure that

1. the top cover of the joint belt has no contact with the outside pulley diameter, in order to prevent the separation of the top cover.
2. the ribs are nevertheless still deep enough inside the pulley in order to ensure an optimum power transmission.

The groove faces must be straight at least to a level of $d_a - 2 \delta h_2$.

DRIVE CALCULATION

EXPLANATION OF SYMBOLS

a	= drive centre distance provisional	[mm]	L_{ith}	= calculated inside belt length	[mm]
a_{nom}	= drive centre distance calculated with a standard belt length	[mm]	L_{dSt}	= standard belt datum length	[mm]
b_d	= datum width		L_{dth}	= calculated belt datum length	[mm]
b_1	= top width		n_g	= speed of the larger pulley	[min ⁻¹]
c_1	= arc of contact correction factor		n_k	= speed of the smaller pulley	[min ⁻¹]
c_2	= service factor		n_1	= speed of the driver pulley	[min ⁻¹]
c_3	= belt length factor		n_2	= speed of the driven pulley	[min ⁻¹]
c_4	= number of idlers factor		P	= motor or normal running power	[kW*]
d_{dg}	= datum diameter of large pulley (DIN 2211 Sheet 1, Table 2)	[mm]	P_B	= design power	[kW*]
d_{dk}	= datum diameter of small pulley (DIN 2211 Sheet 1, Table 2)	[mm]	P_N	= nominal power rating per belt	[kW*]
d_{d1}	= datum diameter of the driver pulley	[mm]	S_a	= minimum static shaft loading	[N]
d_{d2}	= datum diameter of the driven pulley	[mm]	T	= minimum static tension per belt	[N]
E	= belt deflection per 100 mm span length	[mm]	v	= belt speed	[m/s]
E_a	= belt deflection for a given span length	[mm]	x	= minimum allowance above centre distance a_{nom} for belt stretch and wear	[mm]
f	= load used to set belt tension	[N]	y	= minimum allowance below centre distance a_{nom} for easy belt fitting	[mm]
f_B	= flex rate	[s ⁻¹]	z	= number of belts	
i	= drive ratio		α	= angle of belt drive = $90^\circ - \frac{\beta}{2}$	[°]
k	= constant for calculating centrifugal force in belt set		β	= arc of contact on small pulley	[°]
L	= span length	[mm]			
L_{iSt}	= standard inside belt length	[mm]			

* 1 kW = 1 kNm/s

The terms pitch diameter (d_w), pitch length (L_w) and pitch circumference (U_w) used previously have been changed to datum diameter (d_d), datum length (L_d) and datum circumference (U_d) in order to bring them into line with current standard terminology.

DRIVE CALCULATION

OPTIBELT NOMINAL POWER RATING P_N – ARC OF CONTACT CORRECTION FACTOR c_1

The OPTIBELT nominal power ratings P_N in tables 32 to 68 are based upon an internationally accepted basic formula and a theoretical belt life of 25,000 hours under ideal conditions. This formula contains material constants that take into account the quality of the raw materials used and make allowances for production methods. Due to the special qualities of OPTIBELT V-belts, other material constants than those given in DIN have been taken into account. As a result, the nominal OPTIBELT power ratings P_N significantly exceed the ratings given, for wedge belts according to DIN 7753 Part 2 and for classic V-belts according to DIN 2218, for the same theoretical belt life. The nominal power ratings P_N are based on the smallest loaded pulley in the drive system. The belt power rating value P_N is calculated taking into account

- the datum diameter of the smaller pulley d_{dk}
- the speed of the smaller pulley n_k
- the drive ratio i
- an assumed arc of contact at the smaller pulley of $\beta = 180^\circ$
- a reference belt length for the specific belt profile

In order to account for the actual drive data, based on the arc of contact and the belt lengths employed, correction factors for the arc of contact c_1 and length c_3 have been introduced. If required, drive calculations can be provided for any theoretical belt life.

Intermediate values for nominal power rating, arc of contact and length correction factors can be found via linear interpolation.

The factor c_1 corrects the power rating P_N , when the arc of contact is smaller than 180° , as the P_N value is calculated on the arc of contact $\beta = 180^\circ$ on the smaller pulley.

DRIVE CALCULATION

LOAD FACTOR c_2

The service factor c_2 takes account of the daily operating time and of the type of driver and driven machine. It applies exclusively to two-pulley drives. Other arrangements such as drives with tension and guide idlers have not been taken into consideration. Pages 129-131 provide the relevant basic design guidelines for drives with more than two pulleys. Adverse operating conditions (e.g. aggressive dust, particularly high ambient temperatures or the effects of various substances) **have not** been taken into account. As it is practically impossible to cover every conceivable combination of driver/driven machine/operating conditions in a summary that complies with the relevant standards, the service factors are **approximate values**.

In special cases, e.g. increased starting torque (direct on-line starting of fans), in drives with frequent starts and stops, in systems subject to exceptional shock loads, or when significant masses are to be accelerated or braked, the service factor must be increased.

Empirical value:

With a starting torque > 1.8 this figure is to be divided by 1.5 in order to calculate the minimum load factor c_2 .

Example: Starting torque MA = 3.0; c_2 selected 2.0.

Please consult our Applications Engineering Department for the solution of special problems.

Table 23

Examples for Work Machines	Examples for Drive Machines					
	Load factor c_2 for daily operating time (hours)			Load factor c_2 for daily operating time (hours)		
	up to 10	over 10 to 16	over 16	up to 10	over 10 to 16	over 16
Light drives Centrifugal pumps and compressors, belt conveyors (light weight materials), fans and pumps up to 7.5 kW.	1.1	1.1	1.2	1.1	1.2	1.3
Medium drives Plate cutters, presses, chain and belt conveyors (heavy materials), vibrating screens, generators and exciters, bakery machinery, machine tools (lathes and grinders), laundry machines, printing machinery, fans and pumps over 7.5 kW.	1.1	1.2	1.3	1.2	1.3	1.4
Heavy drives Crushing plants, piston compressors, heavy-duty conveyors, directional throw conveyors, push conveyors (screw, plate belts, bucket and shovel conveyors), lifts, briquette presses, textile machinery, paper machinery, piston pumps, excavator pumps, log frame saws, hammer mills.	1.2	1.3	1.4	1.4	1.5	1.6

DRIVE CALCULATION

LENGTH FACTOR c_3 FOR OPTIBELT WEDGE BELTS AND KRAFTBANDS

The length factor c_3 takes into account the flex rate of the belt based on the reference length for the particular belt profile.

This results in the following relationships:

belt length > reference length $c_3 > 1.0$
 belt length = reference length $c_3 = 1.0$
 belt length < reference length $c_3 < 1.0$

DRIVE CALCULATION

GUIDELINES FOR SELECTING THE SUITABLE PROFILES FOR V-BELTS AND KRAFTBANDS

By using the following diagrams, the most suitable belt profiles as far as efficiency and size are concerned, can be selected for a specific application. The most efficient power transmission and economy is achieved by selecting as large a pulley diameter as possible for the profile in question. The limits to be observed are the maximum allowed circumferential speed, namely for

high performance wedge belts $v_{max} = 55 \text{ m/s}^*$;
for classic V-belts $v_{max} = 30 \text{ m/s}$.

If the circumferential speed is outside this recommendation, please contact our Application Engineering Department. Experience has shown that minimum pulley diameters should be avoided. These drives require a larger number of belts with wider pulleys and are therefore more expensive.

In borderline cases we recommend using the next smaller profile belt for the same pulley diameter, as the smaller profile will often save both cost and space. A further recommended solution is the use of the raw edge optibelt SUPER X-POWER M=S V-belts.

Furthermore, we recommend evaluating if the intersection point in the selection diagram is in the limit values of two profiles.

Comparing space requirement and costs, the high performance wedge belt is usually far superior to classic V-belts in almost all industrial drives. For this reason, new constructions use high performance wedge belts almost exclusively. Only in special cases, for replacement parts, or for V-flat drives or special cases where the application of classic V-belts is obligatory.

DRIVE CALCULATION

FORMULAS AND CALCULATION EXAMPLE

Drive machine

3-phase motor
 $P = 132 \text{ kW}$
 $n_1 = 1485 \text{ rpm}$
 Star delta start
 Starting torque $M_A = 0.65 M_N$

Operating conditions

Daily operation: approx. 18 hours
 Number of starts: one per day
 Operating conditions:
 normal room temperature, no exposure
 to oil, water or dust
 Drive centre distance: between
 1300 and 1500 mm, variable
 Pulley diameter: $d_{d1} \leq 300 \text{ mm}$

Driven machine

Fan
 $P = 132 \text{ kW}$
 $n_2 = 825 \pm 15 \text{ rpm}$
 Start-up: under load
 Type of loading: continuous

Note: The calculation takes into account the standard specified according to ISO for datum diameter d_d (formerly pitch diameter d_w) and datum length L_d (formerly pitch length L_w).

Formulas

Load factor

c_2 from table 23, page 75

Design power

$$P_B = P \cdot c_2$$

Selection of belt profile

from diagram 2, page 80

Speed ratio

$$i = \frac{n_1}{n_2} = \frac{d_{d2}}{d_{d1}}$$

Datum diameter of the grooved pulley

d_{d1} selected from table 15, page 52

$$d_{d2} = d_{d1} \cdot i$$

$$d_{d1} = \frac{d_{d2}}{i}$$

Calculation example

$$c_2 = 1.3$$

$$P_B = 132 \cdot 1.3 = 171.6 \text{ kW}$$

SPB

$$i = \frac{1485}{825} = 1.8$$

$d_{d1} = 280 \text{ mm}$ selected

$$d_{d2} = 280 \text{ mm} \cdot 1.8 = 504$$

$d_{d2} = 500 \text{ mm}$ selected from table 15, page 52

DRIVE CALCULATION

FORMULAS AND CALCULATION EXAMPLE

Formulas

Verification of driven unit speed

$$i_{\text{vorh}} = \frac{d_{d2}}{d_{d1}}$$

$$n_{2 \text{ vorh}} = \frac{n_1}{i_{\text{vorh}}}$$

Drive centre distance (preliminary choice)

recommended: $a > 0.7 (d_{dg} + d_{dk})$
 $a < 2 (d_{dg} + d_{dk})$

Datum length of the V-belt

$$L_{\text{dth}} \approx 2 a + 1.57 (d_{dg} + d_{dk}) + \frac{(d_{dg} - d_{dk})^2}{4 a}$$

actual:

$$L_{\text{dth}} = 2 a \cdot \sin \frac{\beta}{2} + \frac{\pi}{2} (d_{dg} + d_{dk}) + \frac{\alpha \cdot \pi}{180^\circ} (d_{dg} - d_{dk})$$

Centre distance

Calculated from L_{dSt} and L_{dth}

$$\text{(if } L_{\text{dSt}} > L_{\text{dth}}) \quad a_{\text{nom}} \approx a + \frac{L_{\text{dSt}} - L_{\text{dth}}}{2}$$

$$\text{(if } L_{\text{dSt}} < L_{\text{dth}}) \quad a_{\text{nom}} \approx a - \frac{L_{\text{dth}} - L_{\text{dSt}}}{2}$$

actual:

$$a_{\text{nom}} = \frac{L_{\text{dSt}} - \frac{\pi}{2} (d_{dg} + d_{dk})}{4} + \sqrt{\left[\frac{L_{\text{dSt}} - \frac{\pi}{2} (d_{dg} + d_{dk})}{4} \right]^2 - \frac{(d_{dg} - d_{dk})^2}{8}}$$

Minimum allowance x/y for adjusting centre distance a_{nom}

x/y from table 28, page 82

Calculation example

$$i_{\text{vorh}} = \frac{500}{280} = \mathbf{1.79}$$

$$n_{2 \text{ vorh}} = \frac{1485}{1.79} = \mathbf{830 \text{ min}^{-1}}$$

required:
 $825 \pm 15 \text{ rpm}$
 (requirement met)

$$a = \mathbf{1400 \text{ mm}}$$
 selected

$$L_{\text{dth}} \approx 2 \cdot 1400 + 1.57 \cdot 780 + \frac{220^2}{4 \cdot 1400} \approx 4033 \text{ mm}$$

next standard length selected from page 27

$$L_{\text{dSt}} = \mathbf{4000 \text{ mm}}$$

$$a_{\text{nom}} \approx 1400 - \frac{4033 - 4000}{2} \approx \mathbf{1383.5 \text{ mm}}$$

$$x \geq \mathbf{45 \text{ mm}} / y \geq \mathbf{20 \text{ mm}}$$

Speed and flex rate of belt

$$v = \frac{d_{dk} \cdot n_k}{19100} \quad (v_{\text{max}} \approx 55 \text{ m/s})$$

$$f_b = \frac{2 \cdot 1000 \cdot v}{L_{\text{dSt}}} \quad (f_{B \text{ max}} \approx 100 \text{ s}^{-1})$$

$$v = \frac{280 \cdot 1485}{19100} = \mathbf{21.76 \text{ m/s}}$$

$$f_b = \frac{2 \cdot 1000 \cdot 21.76}{4000} = \mathbf{10.88 \text{ s}^{-1}}$$

DRIVE CALCULATION

FORMULAS AND CALCULATION EXAMPLE

Formulas

Arc of contact and correction factor

$$\frac{d_{dg} - d_{dk}}{a_{nom}}$$

β° approximate and c_1 from table 22, page 74

$$\text{actual: } \cos \frac{\beta}{2} = \frac{d_{dg} - d_{dk}}{2 a_{nom}}$$

Calculation example

$$\frac{500 - 280}{1383.5} = 0.16$$

$$\left. \begin{array}{l} \beta \approx 170^\circ \\ c_1 = 1.0 \end{array} \right\} \text{linearly interpolated}$$

Length factor

c_3 from table 24, page 76

$$c_3 = 1.02$$

Nominal power per belt

$$P_N \text{ for } \begin{cases} d_{dk} = 280 \text{ mm} \\ i = 1.79 \\ n_k = 1485 \text{ min}^{-1} \end{cases} \begin{array}{l} \text{profile SPB} \\ \text{from table 43, page 100} \end{array}$$

$$P_N = 20.63 + 1.24 = 21.87 \text{ kW}$$

Number of belts

$$z = \frac{P \cdot c_2}{P_N \cdot c_1 \cdot c_3}$$

$$z = \frac{132 \cdot 1.3}{21.87 \cdot 1.0 \cdot 1.02} = 7.69$$

suggested:

8 optibelt SK wedge belts SPB 4000 L_d S=C plus

Profile SPB:

Minimum static tension per belt

(multiply by factor 1.3 at initial installation)

$$T \approx \frac{500 \cdot (2.04 - c_1) \cdot P_B}{c_1 \cdot z \cdot v} + k \cdot v^2$$

k from diagram 8, page 138

$$T \approx \frac{500 \cdot (2.04 - 1.0) \cdot 171.6}{1.0 \cdot 8 \cdot 21.76} + 0.19 \cdot 473.5 \approx 593 \text{ N}$$

initial installation:

$$T = 593 \text{ N} \cdot 1.3 = 771 \text{ N}$$

Minimum static shaft load

(multiply by factor 1.3 at initial installation)

$$S_a \approx 2 T \cdot \sin \frac{\beta}{2} \cdot z$$

$$S_a \approx 2 \cdot 593 \cdot 0.9962 \cdot 8 \approx 9452 \text{ N}$$

initial installation:

$$S_a = 9452 \text{ N} \cdot 1.3 = 12288 \text{ N}$$

Belt deflection

$$E_a \approx \frac{E \cdot L}{100}$$

E from diagram 8, page 138

$$L = a_{nom} \cdot \sin \frac{\beta}{2}$$

$$E_a \approx \frac{2.7 \cdot 1378}{100} \approx 37 \text{ mm}$$

$$E \approx 2.7 \text{ mm}$$

$$L = 1383.5 \cdot 0.9962 = 1378 \text{ mm}$$

DRIVE CALCULATION

optibelt CAP

The drive requires:

- 8 piece(s) optibelt SK wedge belts SPC 6300 L_d S=C plus
- optibelt KS V-grooved pulley for taper bushes TB SPC 400-8
- optibelt TB taper bush 4545 (bore diameter 55-110 mm)
- optibelt KS V-grooved pulleys for taper bushes TB SPC 800-8
- optibelt TB taper bush 5050 (bore diameter 70-125 mm)

v > 42 m/s.
Please consult our
Application Engineering
Department.

v [m/s]

Dynamically balanced (for details see DIN 2211)

Pulleys

Note: Pulley diameters shown are outside diameters for sections 5V/15N, 5V/15J.

POWER RATINGS

optibelt **SK PROFILE SPC**

NOMINAL POWER RATING P_N [kW] FOR $\beta = 180^\circ$ AND $L_d = 5600$ mm

Table 44

SPECIAL DRIVES

V-FLAT DRIVES

The V-flat drive comprises one grooved pulley and one flat pulley. This type of gear can, under certain conditions, be used for drives with intermittent loading or with large moments of inertia. As flywheels or flat pulleys are often

already present, the costs of the drive can be reduced. When changing over a flat belt drive to a V-flat drive, it will usually be economical to continue to use the flat pulley.

- a = drive centre distance [mm]
- b = face width of the flat pulley [mm]
- b_v = bottom width of the belt [mm]
- b_2 = face width of the grooved pulley [mm]
- D_a = outside diameter of the flat pulley [mm]
- D_Z = correction factor for determination of the theoretical diameter [mm]
- d_a = outside diameter of the grooved pulley [mm]
- d_d = datum diameter of the grooved pulley [mm]
- F_f = contact area of V-belt and flat pulley [cm²]
- f = correction factor for calculating the face width of the flat pulley [mm]
- h = height of crown per 100 mm pulley face width [mm]
- i = speed ratio
- L_{ath} = calculated outside length of the kraftband [mm]
- L_{dth} = calculated datum length of the V-belt [mm]
- p_f = specific surface pressure [N/cm²]
- P = power to be transmitted by the belt drive [kW]
- S_n = circumferential force [N]
- α = arc of contact on the flat pulley = $360^\circ - \beta$ (°)
- k_f = factor
datum length $L_d \hat{=} \text{pitch length } L_w$

SPECIAL DRIVES

V-FLAT DRIVES

Calculating V-flat drives

The calculation of V-flat drives is based on the same method as presented on pages 85 to 87. In order to ensure reliability and efficiency, the V-flat belt drive must meet the following requirements:

- The small pulley must always be V-grooved.
- When using single belts, only classic V-belts in profiles Z/10, A/13, B/17, C/22, D/32, E/40 must be used.
- Wedge belts must never be used as their narrow base and larger relative height tends to make them turn and twist.
- All optibelt KB kraftbands – both with wedge belts and classic V-belts – are particularly suitable for this type of drive due to their single belt characteristic. Turning over even under extreme shock load conditions is prevented.
- A V-flat drive is particularly economic when

$$kf = \frac{D_a - d_d}{a} \text{ is between } 0.5 \text{ and } 1.15$$

The optimum drive dimensioning is achieved when $kf = 0.85$. If the factor kf is outside the recommended range, it is more economical to design a standard V-belt drive.

- The following recommendations result from these requirements:

	Classic V-belts	Kraftbands
Speed ratio	$i = \frac{D_a + D_z}{d_d} \geq 3$	$i = \frac{D_a + D_z}{d_a} \geq 3$
Centre distance	$a_{zul} \geq D_a$	$a_{zul} \geq D_a$
	$a = \frac{D_a - d_d}{0.85}$	$a = \frac{D_a - d_a}{0.85}$
kf factor	$kf = \frac{D_a - d_d}{a}$	$kf = \frac{D_a - d_a}{a}$
	$0.5 \leq kf_{zul} \leq 1.15$	

- When calculating the number of belts and the belt tension, it should be noted that a special arc of contact factor c_1 must be used as shown in the following table.

Table 69: Arc of contact factor c_1 (only for V-flat drives)

$kf = \frac{D_a - d_d}{a}$	$\beta =$	c_1
0	180°	0.75
0.07	176°	0.76
0.15	170°	0.77
0.22	167°	0.79
0.29	163°	0.79
0.35	163°	0.79
0.40	156°	0.81
0.45	153°	0.81
0.50	150°	0.82
0.57	146°	0.83
0.64	143°	0.84
0.70	140°	0.85
0.75	137°	0.85
0.80	134°	0.86
0.85	130°	0.86
0.92	125°	0.84
1.00	120°	0.82
1.07	115°	0.80
1.15	110°	0.78
1.21	106°	0.77
1.30	100°	0.73
1.36	96°	0.72
1.45	90°	0.70

- For classic V-belts, the length is calculated using the datum length L_d , and for kraftbands using the outside length L_a . Therefore, the correction factor D_z must be added to the outside diameter of the flat pulley in order to approximate the theoretical design diameter.

Correction factor D_z for determination of the theoretical design diameter

Classic V-belts

Calculation of the datum length for Classic V-belts

$$L_{dth} \approx 2a + 1.57 (d_d + D_a + D_z) + \frac{(D_a + D_z - d_d)^2}{4a}$$

Calculation of the outside length for kraftbands

$$L_{ath} \approx 2a + 1.57 (d_a + D_a + D_z) + \frac{(D_a + D_z - d_a)^2}{4a}$$

Length conversion factors are given on pages 161/162. Datum length $L_d \triangleq$ pitch length L_w

SPECIAL DRIVES

V-FLAT DRIVES

- The flat pulley should be shaped cylindrically. With existing flat pulleys that are re-used for the V-flat belt drive, the height of the crown should be checked.

The following conditions must be met:

Maximum crown height

$h_{max} = 1 \text{ mm per } 100 \text{ mm pulley face width}$

$$h = \frac{D_a - d_a}{2} \quad (h < h_{max})$$

In addition, the pulley face width must be calculated or checked as shown in the following example:

Given/Calculated:

V-grooved pulley 6 grooves
 Profile B/17
 Drive centre distance a 850 mm

Solution:

$$b = b_2 + f$$

$$b = 120 + 35 = \mathbf{155 \text{ mm}}$$

b_2 for classic V-belts, page 51, table 14.

b_2 for kraftbands, page 55, table 20

f from table 70.

Selected standard flat pulley according to DIN 111 with crown width $b = \mathbf{160 \text{ mm}}$

Surface pressure on flat pulley p_f [N/cm²]*

$$p_f = \frac{S_n}{F_1}$$

Area of belt contact on flat pulley F_1 [cm²]

$$F_1 = \frac{D_a \cdot \pi \cdot \alpha \cdot b_u \cdot z}{36000}$$

Recommended surface pressure p_f [N/cm²]*

$$p_f \leq 4 \text{ N/cm}^2*$$

* $10 \text{ N/cm}^2 = 1 \text{ Bar} = 10^5 \text{ Pascal}$

Formula:

Calculation of the static belt tension for V-flat belt drives T [N]

$$T = \frac{500 \cdot (2.25 - c_1) \cdot P_B}{c_1 \cdot z \cdot v} + k \cdot v^2$$

In addition to the calculation method on pages 85 to 87 the static belt tension for V-flat drives must be calculated according to the formulae given here.

SPECIAL DRIVES

TENSION/GUIDE IDLERS

Idlers are grooved or flat pulleys that do not transmit any power in a drive system. Due to the fact that additional flexing stress is created in the belt, it is recommended that idlers are only used sparingly under the following conditions if possible:

- with fixed drive centres in order to produce the required tension and to take up the maximum possible belt stretch and wear,
- as an idler pulley when dealing with extremely long free belt spans that are subject to twisting,
- as outside idlers where the arc of contact on one of the loaded pulleys is too low. Their inclusion increases the arc of contact and often reduces excessive slip or eliminates the need to increase the number of belts,
- as idler pulleys and guide idlers on drives where pulleys are not all on the same plane such as quarter turn drives,
- to guide belts past obstructions,
- as pneumatically, hydraulically or spring loaded idlers to maintain a constant tension,
- as clutching idlers with which the driven pulley can be engaged or disengaged. Complex clutches are no longer required. Because of their single belt characteristics, optibelt KB kraftbands are particularly suited for these applications.

If, for the reasons listed above, it is absolutely essential to employ idlers, the following criteria should be considered when designing the drive:

- idler configuration
- position of the idler in the belt span
- idler diameter
- idler design
- adjustment allowance of the idler for installation and initial and subsequent tensioning of the belt
- correction of the power rating P_N

Idler configuration

In principle, idlers can be used as inside or outside idlers depending on the drive situation. Unless design requirements call for an outside idler, the inside idler is usually more advantageous. Its diameter can be kept smaller than that of the outside idler.

Depending on the belt type, **inside idlers** can either be grooved or flat pulleys.

Table 71: Profile dimensions

Belt type	V-grooved pulley	Flat pulley
High performance wedge belts DIN 7753 Part 1 SPZ; SPA; SPB; SPC	•	
High performance wedge belts USA standard RMA/MPTA 3V/9N; 5V/15N; 8V/25N	•	
Classic V-belts DIN 2215 Z/10; A/13; B/17; 20; C/22; 25; D/32; E/40	•	•
Kraftbands with high performance wedge belts 3V/9J; 5V/15J; 8V/25J; SPA; SPZ; SPB; SPC	•	•
Kraftbands with classic V-belts A/HA; B/HB; C/HC; D/HD	•	•

For raw edge V-belts and kraftbands the same requirements as given in table 71 apply.

Inside idlers reduce the arc of contact on the loaded pulleys and with it the arc of contact correction factor c_1 . When calculating the number of belts, the arc of contact correction factor should be selected for the position of the idler at the point of maximum belt stretch (see table 73, page 131).

Outside idlers generally have to be flat pulleys as they are running on the back of the belt. They increase the arc of contact. Care must be taken to ensure that the maximum possible belt stretch is taken up and that contact with the opposite span is prevented. The reverse bending caused by outside idlers will lead to a reduction of the belt service life.

Special V-belt constructions on request.

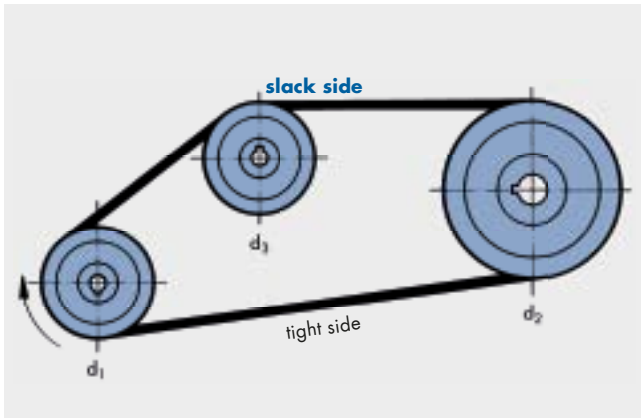

SPECIAL DRIVES

TENSION/GUIDE IDLERS

Position of the idler in the belt span

Theoretical power transmission formulas and actual practice have shown that idlers should, wherever possible, be placed in the slack side of the drive. The tension idler force can be reduced very significantly then. A spring loaded idler must not be employed in a reversing drive as the slack and tight sides of the drive are constantly changing. Our Application Engineering Department will be pleased to assist you when spring loaded idlers present special problems.

Fig. 1

Grooved pulleys can be used as inside idlers anywhere on the slack side. Where possible, however, the arc of contact should be the same on both pulleys when the idler reaches its end position, i.e. belt stretch is at its maximum.

Fig. 2

Flat pulleys, whether used as inside or outside idlers, are to be placed as far as possible away from the grooved pulley on to which the belt runs next. Any alignment errors between the idler and the pulley and the resultant sideways movement of the belt on the pulley are thus avoided.

Fig. 3

On drives with long belt spans, grooved pulleys are the preferred choice for inside idlers because with flat pulleys transverse vibrations and belt turnover can occur.

Minimum diameter for inside idlers

Inside idler > smallest loaded pulley in the drive system

Minimum diameter for outside idlers

Outside idler > 1.35 x smallest loaded pulley in the drive system

Exceptions:

Profile	Diameter of the smallest pulley in the drive [mm]	Minimum diameter of the outside idler [mm]
Z/10	56- 63	90
A/13	71- 90	125
SPZ, 3V/9N	63- 90	125
SPA	90-112	150

The belt service life is significantly reduced if the minimum recommended idler diameter is less than the recommended size. The use of an OPTIBELT special construction can significantly improve service life.

Idler design

Grooved pulleys which are used as idlers can usually have standard pulley dimensions. On drives with too severe vibration and long drive centre distances, it is recommended that deep grooved pulleys are used.

Flat pulleys should, if possible, be cylindrical and not crowned. Flanged pulleys are recommended as belt guides. The edges formed by the contact surface and pulley flange should be sharp. Round edges encourage the belt to run on the flanges causing it to turn over.

SPECIAL DRIVES

TENSION/GUIDE IDLERS

The face width or the contact surface between the two flanges is calculated as follows:

$$b = b_2 + m$$

b = face width/contact surface [mm]

b₂ = face width of the grooved pulley [mm]

m = additional value [mm]

Profile	Additional value m [mm]
SPZ, 3V/9N, Z/10	15
SPA, A/13	20
SPB, 5V/15N, B/17	25
SPC, C/22	30
8V/25N	35
D/32	40
E/40	45

This also applies to raw edge V-belts

Drive calculation

Calculating the length and determining the number of belts is basically the same as for 2-pulley drives. Certain details are, however, to be noted:

1. Calculate the belt length over two pulleys using the formula: see notes on standards page 172.

$$L_{dth} \approx 2a + 1.57 (d_{dg} + d_{dk}) + \frac{(d_{dg} - d_{dk})^2}{4a}$$

2. As the belt has to be fitted without force with fixed centre distances, the double adjustment y must be added to the belt length L_{dth} (see pages 82/83).

$$L_d = L_{dth} + 2 y$$

3. The next largest standard length L_{dSt} should then be selected. A check should be made, usually on the drawing, to determine whether the belt can be adequately tensioned with the idler in the outermost position. In this idler position, both the standard length L_{dSt} and the double adjustment x must be taken up (see pages 82/83).

$$L_d \text{ for idler end position} = L_{dSt} + 2 x$$

Fig. 4

Number of belts

The use of idlers increases the bending stress in the belts. To avoid a reduction in belt service life, the idler correction factor c₄ must also be included in the calculation. This correction factor takes into account the number of idlers that are larger than the minimum diameter.

Table 72

Number of idlers	c ₄
0	1.00
1	0.91
2	0.86
3	0.81

The nominal power rating P_N per belt is, as before, based on the smallest loaded pulley.

Calculation of the arc of contact correction factor c₁ must be based on the smallest contact angle of the loaded pulley which occurs when the belt is stretched to its maximum limit.

Table 73: Arc of contact correction factor c₁

β =	c ₁	β =	c ₁
75°	0.82	175°	1.00
80°	0.84	180°	1.00
85°	0.86	185°	1.00
90°	0.88	190°	1.00
95°	0.90	195°	1.01
100°	0.91	200°	1.01
105°	0.92	205°	1.01
110°	0.93	210°	1.01
115°	0.94	215°	1.01
120°	0.95	220°	1.01
125°	0.96	225°	1.01
130°	0.96	230°	1.01
135°	0.97	240°	1.02
140°	0.97	250°	1.02
145°	0.98		
150°	0.98		
155°	0.99		
160°	0.99		
165°	0.99		
170°	1.00		

The following formula for determining the number of belts is obtained using the idler correction factor c₄:

$$z = \frac{P \cdot c_2}{P_N \cdot c_1 \cdot c_3 \cdot c_4}$$

SPECIAL DRIVES

TWIST DRIVES

Drives with crossing belt spans are often simply termed twist drives. These can be drives where the shafts are not parallel, whose pulleys and idlers are not all arranged on one plane, or drives with two parallel but counter rotating shafts. Because of the twisting of the belt, this type of drive requires a certain degree of lateral bending flexibility. Due to the cross section of V-belts, flat belts are better suited for this application. In most cases twist drives use single V-belts, but drives using belt sets are also possible. The crossing of the belt spans and the non-aligned entry of the belt into the pulley leads to a reduction of the belt service life. The entry and exit angle between the belt and the pulley plane should not be more than 5° .

The required inclination of the shafts and the pulleys relative to each other and the belt entry and exit angles should be confirmed by practical tests. In addition, certain critical drives may have a considerably improved safety factor if special constructions by OPTIBELT are used. The most important types of twist drives and the according design guidelines are illustrated below.

Quarter twist drive

The term quarter twist drive is used to describe systems where the shafts are at an angle of 90° to each other. The ratio i or $1 : i$ of quarter twist drives should not exceed 2.5.

Where this is not possible, a two stage drive should be employed, in which one stage is a standard V-belt drive.

Quarter twist drive – ratio i or $1 : i < 2.5$

Quarter twist drive – ratio i or $1 : i > 2.5$

SPECIAL DRIVES

TWIST DRIVES

Design guidelines for quarter twist drives

1. $a_{\min} = 5.5 (d_{dg} + b_2)$
2. The drive must be aligned in such a way that a straight line drawn through the centre of the vertical shaft runs through the centre of the face b_2 of the pulley on the horizontal shaft (plan view). The horizontal shaft must be at right angles to this straight line.
3. The horizontal centre line of the pulley on the horizontal shaft must be above and at a distance y_1 from the centre line of the pulley on the vertical shaft (side view). The distance y_1 changes with the centre distance "a".

Table 74

Drive centre distance a [mm]	y_1 [mm] Classic V-belts	y_1 [mm] Wedge belts
1200 ≤ 1500	5	–
> 1500 ≤ 2000	8	5
> 2000 ≤ 2500	12	8
> 2500 ≤ 3000	17	10
> 3000 ≤ 3500	25	15
> 3500 ≤ 4000	35	25
> 4000 ≤ 4500	45	30
> 4500 ≤ 5000	55	40
> 5000 ≤ 5500	65	45
> 5500 ≤ 6000	80	55
> 6000	100	65

4. The direction of rotation must be arranged so that the tight side S_1 is at the bottom.
5. Deep grooved pulleys should be specified if possible for single belt drives. This ensures an improved entry and exit of the belt, thus preventing turnover.
6. Never specify deep grooved pulleys when using kraftbands. Kraftband pulleys should always be used. We recommend, in any case, consulting our Application Engineering Department.
7. When calculating the number of belts, the examples given on pages 85 to 87 should be followed. An arc of contact correction factor $c_1 = 1$ must always be used.
8. The static belt tension "T" should be calculated using the formula on page 128.
9. The drive or work machine must be adjustable so that the belt can be fitted without force, the necessary tension can be applied and the belt stretch and wear can be taken up during its service life.

SPECIAL DRIVES

TWIST DRIVES

Eighth twist drives

Eighth twist drives are seldom necessary. The shafts in this drive system are at an angle of 45° to each other.

Design guidelines

- $a_{\min} = 4 (d_{dg} + b_2)$
- Otherwise the design guidelines for quarter twist drives are applicable.

Drives with 180° twist

The driver and the driven shafts are, as with conventional drives, parallel to each other. The belt is twisted 180° so

that both spans cross. A change in direction is thus achieved at very little cost.

Design guidelines

- In order to enable a perfect running of the belts in the pulley grooves, the belt span length must not be less than the minimum given in the following table.
- If possible, the crossover point of both belt spans should be arranged in the centre of the drive. The rubbing of the belt spans against each other is at a minimum at this point. In order to avoid contact completely, it is recommended that a guide pulley is placed in the slack side S_2 near the crossover point.

Tabelle 75

Profile	Minimum span length L_{\min} [mm]

- Length calculation

$$L \approx 2a + 1.57 (d_g + d_k) + \frac{(d_g + d_k)^2}{4a}$$

- Otherwise, the design guidelines as described in points 4 to 9 for quarter twist drives apply.

◀ these values also apply for raw edge belts

SPECIAL DRIVES

DRIVE ELEMENTS WITH ARAMID STRUCTURES

Aramid is an organic polyamide fibre that is manufactured in a complex chemical process. It may be used wherever maximum stress resistance and reliability are required. The processing of this fibre requires the highest level of experience and know-how as well as sophisticated testing facilities. Aramid is used as the tension cord material for highly loaded V-belts and kraftbands.

Structure and properties

Compared to materials commonly used for tension cords e.g. polyesters, aramid stands out due to its extremely low-stretch properties. Its tensile strength is twice as high as that of a standard fibre in the same thickness.

	Tensile strength [cN/tex]	Stretching at break [%]	Tension at 2 % [cN/tex]
Polyester	81	14	15
Aramid	190	4	73

cN = Centi-Newton Thread weight: 1 tex = 1 g/1000 m

Despite its extreme strength, this fibre is remarkably flexible and has sufficient elasticity to absorb shock loads or vibration.

These properties, which are of special importance for V-belts and kraftbands, result in huge improvements in comparison to conventional constructions.

OPTIBELT V-belts in aramid cord structure comprise:

The high quality, specially processed aramid tension cord is embedded in a special rubber compound. The upper and substructure are thus supported effectively. These consist of a fibre reinforced polychloroprene rubber compound. The cover fabric is treated with a rubber compound on both sides and covers the whole belt.

Applications

The advantages of OPTIBELT V-belts and kraftbands with aramid tension cords are best applicable where

- high power transmission is required
- there is only small installation space
- there is little adjustment range
- high temperature influences occur

Thus, with the same number of belts and unchanged drive parameters, significantly higher power levels can be transmitted without reducing the service life of the belts. Even drive constructions that have previously had to be classified as critical may now be considered risk free. From now on, load limits apply as safety buffer zones; minimal belt stretch results in virtually maintenance-free running.

For these reasons OPTIBELT V-belts and kraftbands with aramid tension cord are to be found on drives with exceptional loading requirements –

- on critical drives in industrial applications
- on special machines
- on agricultural machinery
- on horticultural machinery

Attention: With two-pulley drives, particular requirements are placed on the shafts and bearings. It is recommended to use spring-loaded idlers (inside/outside idlers) with aramid V-belts / aramid kraftbands.

A discussion of all the relevant criteria would be beyond the scope of this manual. We therefore recommend contacting our Application Engineering Department to discuss your special requirements.

Special applications can also be designed with raw edge V-belts and kraftbands employing aramid tension cords.

Drive calculation

Calculation should follow the example given on pages 85 to 87.

Please ask for the higher power ratings.

5V/15J	$\geq 5V 500 / 15J 1270 L_a$	$\leq 5V 3550 / 15J 9017 L_a$	
8V/25J	$\geq 8V 1000 / 25J 2540 L_a$	$\leq 8V 4750 / 25J 12065 L_a$	

Further profiles and length ranges as well as minimum order quantities on request.

Datum length $L_d \hat{=} \text{pitch length } L_w$; outside length = L_a

DESIGN SUPPORT

BELT TENSION FOR OPTIBELT V-BELTS

For proper power transmission and for achieving an acceptable belt service life, the correct belt tension is of the utmost importance.

Too low or too high belt tension will lead to the premature failure of the belts. Over tensioning often leads to bearing failure on the driver or the driven machine. Experience has shown that unscientific belt tensioning methods, such as the "thumb pressure method", are not suitable for applying the optimum tension to the drive for maximum efficiency. It is therefore recommended that for each drive the required static belt tension "T" is calculated using the formulas by OPTIBELT. This tension is the lowest possible required by a drive to transmit the highest power level from the drive, taking account of the normal amount of slip.

Once the belt has been fitted and the initial tension has been applied, it should be checked using a OPTIBELT tension gauge.

The belt should be monitored regularly during the first hours of operation. Experience has shown that the first re-tensioning should be carried out after approximately 30 minutes to four hours operating under full load. In doing so, the initial stretch is absorbed.

After approximately 24 hours of operation, it is often recommended to check the drive and re-tension the belts if necessary, particularly when not continuously run under full load. The time between checks can be significantly increased then. Also see our installation and maintenance advice on pages 150 to 151.

Too high or too low tension of the drive will be avoided if the belt tension is calculated, set and checked using one of the following methods.

I. Checking the belt tension by span deflection

This method provides an indirect measurement of the calculated or actual static belt tension. It is applicable for belt sections SPZ, SPA, SPB, SPC, 3V/9N, 5V/15N, Z/10, A/13, B/17, 20, C/22, 25, D/32, XPZ, XPA, XPB, XPC, 3VX, 5VX, ZX/X10, AX/X13, BX/X17, CX/X22.

E	= belt deflection per 100 mm span length	[mm]
E _a	= belt deflection for a given span length	[mm]
f	= load used to set belt tension	[N]
k	= constant for calculation of centrifugal force	
L	= drive span length	[mm]
S _a	= minimum static shaft load	[N]
T	= minimum static tension per belt	[N]

1. Calculation of the static belt tension using the following formula:

$$T \approx \frac{500 \cdot (2.02 - c_1) \cdot P_B}{c_1 \cdot z \cdot v} + k \cdot v^2$$

During new installation, the drive is to be tensioned with 1.3 T.

2. Determine the belt deflection per 100 mm span length E from the belt tension/deflection diagrams 8 to 11.

3. Calculate the belt deflection for a given span length E_a for the actual drive span length L.

$$E_a \approx \frac{E \cdot L}{100}$$

$$L = a_{nom} \cdot \sin \frac{\beta}{2}$$

Apply test load "f" (taken from diagrams 8 to 11 for the appropriate belt profile) to the centre of, and perpendicular to, the span as illustrated above. Measure the deflection and if necessary adjust the centres until the correct belt tension is achieved.

II. Checking the belt tension via speed measurement

This method checks belt tension using the theoretical slip. The speed of the driver and driven pulleys are measured first in an unloaded condition and then under load.

S	= slip	[%]
n _{1L}	= driver pulley speed, no load	[rpm]
n _{2L}	= driven pulley speed, no load	[rpm]
n _{1B}	= driver pulley speed, under load	[rpm]
n _{2B}	= driven pulley speed, under load	[rpm]

Formula for calculating the slip:

$$S = \left(1 - \frac{n_{1L}/n_{2L}}{n_{1B}/n_{2B}}\right) \cdot 100$$

At the rated loading, the slip should not exceed 1%. The belt service life is considerably shortened due to incorrectly low tension or overloading with a slip of over 2%.

DESIGN SUPPORT

BELT TENSION FOR OPTIBELT V-BELTS AND optibelt **KB** KRAFTBANDS

III. Belt tensioning via "length addition value" method

It has become evident that span deflection methods are not ideal for checking the tension of kraftbands of all profiles, and of individual belts. The following, very simple method for the setting and checking of belt tension is therefore recommended:

1. Calculation of the static belt tension "T":

$$T \approx \frac{500 \cdot (2.02 - c_1) \cdot P_B}{c_1 \cdot z \cdot v} + k \cdot v^2$$

2. Measure the setting length "M" of the kraftband or the single belt, on the top surface of the kraftband or on the belt top surface when not tensioned. However the belt can be measured when fitted to the drive, provided that it is completely **without** tension.

3. Procedure

- a) Install the kraftband or the single belt on the pulleys. Provisionally tighten the belt in order to seat it into the pulley grooves.
- b) Next, completely slacken the kraftband or the single belt.
- c) Mark two lines on the top of the belt, with distance "M". The lines must be marked on the free span length, not where the belt is on the pulley, ("M" should ideally be 1000 mm minimum or a multiple of it).

Important: The longer the measured profile, the more accurate the tension setting will be.

4. Calculate the length additional value "A" using the formula:

$$A = \frac{M \cdot R}{1000}$$

R = Dehnungsfaktor aus Tabelle 76, Seite 141

5. Tighten the kraftband or the single belt until the length calculated under point 4 is reached. The drive is now correctly tensioned.
6. If the drive has to be re-tensioned, the belts have to be slackened first so that they can be re-measured completely free of tension. After that, the procedure described in paragraphs 3 to 5 applies.

Example:

$$P_B = 1136 \text{ kW}$$

$$c_1 = 0.97$$

$$v = 25.91 \text{ m/s}$$

Drive arrangement with one set comprising:

2 optibelt KB kraftbands 4-8V 3750/25J 9525 L₀

2 optibelt KB kraftbands 5-8V 3750/25J 9525 L₀

$$T \approx \frac{500 \cdot (2.02 - 0.97) \cdot 1136}{0.97 \cdot 18 \cdot 25.91} + 0.69 \cdot 25.91^2 = 1782 \text{ N}$$

„M“ selected 4000 mm

$$A = \frac{4000 \cdot 5.4}{1000} = 21.6 \text{ mm}$$

Tighten the kraftband until the length additional value is reached. This will set the correct tension.

At initial installation, the static belt tension must be multiplied by 1.3.

DESIGN SUPPORT

CALCULATING THE AXIAL LOAD/SHAFT LOAD UNDER DYNAMIC CONDITIONS

Using drives that have electric motors as drive machines and are/or will be designed according to DIN 2211 Part 3, ensures that the dynamic stress that occurs can be absorbed by the appropriate shafts and bearings of the motor.

As often occurs, drives with

- electric motors out with the DIN standards for the determined dependencies of pulley diameter and power,
- combustion engines,
- turbines as well as,
- heavy duty drives such as stone crushers, calenders or heavily loaded mills

than the dynamic bearing load must be calculated. This is the load on both shaft and bearing on the driver and driven unit.

Precise calculation of the "Dynamic axial load" prevents unnecessary costs due to

- premature failure of the bearing,
- breaking of the shaft,
- over dimensioned bearings and shafts.

In the case of 2-pulley drives, the driver and driven shafts and the bearings are subjected to the same dynamic axial force, but in opposite directions. When idlers are employed, the magnitude and the direction of the axial force are almost always different on each pulley. If the magnitude and direction of the dynamic axial force is to be determined, a graphical solution, using a vector diagram for the dynamic forces in the tight side S_1 and the slack side S_2 , is recommended.

If only the magnitude of the dynamic axial force has to be determined, this can be achieved using the formula for " $S_{a \text{ dyn}}$ ". Both procedures will be illustrated in the following example. Data from the calculation examples given on pages 85 to 87

$P_B = 171.6 \text{ kW}$
 $v = 21.76 \text{ m/s}$

$c_1 = 1.00$
 $\beta = 170^\circ$

Dynamic tension on the tight side during belt operation

$$S_1 \approx \frac{1020 \cdot P_B}{c_1 \cdot v}$$

$$S_1 \approx \frac{1020 \cdot 171.6}{1.0 \cdot 21.76} \approx \mathbf{8044 \text{ N}}$$

Dynamic tension of the slack side during belt operation

$$S_2 \approx \frac{1000 \cdot (1.02 - c_1) \cdot P_B}{c_1 \cdot v}$$

$$S_2 \approx \frac{1000 \cdot (1.02 - 1.0) \cdot 171.6}{1.0 \cdot 21.76} \approx \mathbf{158 \text{ N}}$$

A) Graphical solution

B) Solution using the formula $S_{a \text{ dyn}}$

Axial load under dynamic conditions

$$S_{a \text{ dyn}} \approx \sqrt{S_1^2 + S_2^2 - 2 \cdot S_1 \cdot S_2 \cdot \cos \beta}$$

$$S_{a \text{ dyn}} \approx \sqrt{8044^2 + 158^2 - 2 \cdot 8044 \cdot 158 \cdot 0.9848} \approx \mathbf{8200 \text{ N}}$$

TECHNICAL TOOLS

FREQUENCY TENSION TESTER **optibelt TT MINI S**

The optibelt TT MINI S frequency tension tester is used for checking the tension of drive belts via frequency measurement.

This newly designed measuring device offers universal application options for drives in machine construction, the automotive industry and various other applications due to its compact design.

Even difficult to reach spots can be tackled with the TT MINI S.

The tension values of V-belts, ribbed belts and timing belts can easily and quickly be checked.

Furthermore, the TT MINI S offers:

- value display in Hertz [Hz]
- large measuring range from 10 to 600 Hz
- simple and repeatable measuring
- small, compact design (mobile phone size)
- automatic switch off
- factory calibration and CE approval

After switching on the device, it is ready for immediate measurement. The mounted and tensioned belt is made to vibrate by finger pressure or by hitting it with something. The measuring head has to be held above the belt to function, the TT MINI S starts the measurement and displays the result in Hertz [Hz]. The state, colour and type of the belt do not influence the measurement, since the measurement is based on an acoustic signal.

Belt tension calculation

Formula: $T = 4 \cdot k \cdot L^2 \cdot f^2$

$T \triangleq$ belt tension [N]
 $k \triangleq$ meter weight [kg/m]
 $L \triangleq$ belt length [m]
 $f \triangleq$ frequency [Hz]

TECHNICAL DATA

FREQUENCY TENSION TESTER optibelt TT OPTICAL

The optibelt TT OPTICAL frequency tension tester is used for checking the tension of drive belts via frequency measurement.

This newly designed measuring device offers universal application options for drives in machine construction, the automotive industry and various other applications due to its compact design.

The tension values of V-belts, ribbed belts and timing belts can easily and quickly be checked.

Furthermore, the TT OPTICAL offers the following advantages:

- easy handling
- measuring range 5 Hz to 500 Hz
- compact design
- highest reliability
- high measuring accuracy
- no influence due to background noise
- factory calibrated
- CE approved

After switching on, the device is instantly ready for measuring. The pre-tensioned belt is set into vibration by impulse with finger or any other object. The measuring detector has to be placed over the belt. TT OPTICAL starts measuring and the result is displayed in Hertz [Hz].

The structure, colour and type of drive belt has no influence on the measurement, as an optical measuring method is used.

TECHNICAL DATA

Display:

LCD, two-line display

Measuring range:

50 to 500 Hz

Measuring accuracy:

< 10 Hz = 0.5 Hz

> 10 Hz = 1.0 Hz

Sensor:

optical, with sensor

Power supply:

9 V block battery

Operating time/Switch off automatic:

> 48 hours non-stop operation
(depending on the battery quality),
automatic switch off after 2 minutes

Dimensions:

170 mm x 45 mm x 30 mm

Weight:

≤ 100 g

Tested:

CE approval, RoHS,
factory calibration

DESIGN SUPPORT

TECHNICAL TOOLS

optibelt OPTIKRIK TENSION GAUGES

This gauge offers a simple method of belt tensioning.

It helps e. g. mechanics during the maintenance of belt drives when technical data is not known and the optimum tension therefore cannot be calculated. This method requires only knowledge of the diameter of the small pulley and the belt profile. The OPTIBELT tension gauge is used to directly read the belt tension. By reducing or increasing the belt tension the desired value is achieved.

For different tensioning values, OPTIKRIK 0, I, II, III with corresponding measurement ranges are available.

Instructions for use

1. The gauge is placed in the middle between the two pulleys on the back of the belt, in the case of sets of belts ideally on the belt in the middle. (Before doing so, please press the indicator completely into the gauge body.)
2. Place the gauge loosely on the belt to be measured and slowly press a finger onto the pressure surface.
3. Try not to touch the gauge with more than one finger during the measuring process.
4. When you feel or hear a definite "click", immediately release the pressure, the indicator arm stays in the measured position.
5. Carefully lift the gauge without moving the indicator arm. Read the belt tension (see diagram). Read the measurement at the exact point where the top of the indicator arm crosses the scale.
6. Reduce or increase the belt tension according to the measurement result until it is within the desired tension level.

DESIGN SUPPORT

INSTALLATION AND MAINTENANCE SUPPORT

DESIGN SUPPORT

INSTALLATION AND MAINTENANCE SUPPORT

Safety: Before starting any maintenance work, it is extremely important that any machine components are in a safe position which cannot be changed during maintenance work. In addition, safety recommendations of the manufacturer are to be strictly observed.

optibelt KS V-GROOVED PULLEY WITH TAPER BUSH

The V-grooved pulleys are to be checked for damage and correct dimensions before installation.

Installation

1. All shiny surfaces like bore and tapered surface of the pulley have to be cleaned and degreased. Insert taper bush in hub and align all connecting bores. Half tapped holes have to face half plain bores.
2. Stud screws (TB 1008-3030) and/or cap head screws (TB 3525-5050) should be slightly greased and screwed in. Do not yet tighten the screws.
3. Clean and degrease the shaft. Push pulley with taper bush to the desired position on the shaft. See alignment of the V-grooved pulley.
4. When using a key, it has to be inserted in the hub of the shaft first. Between key and bore hub there needs to be a certain tolerance.
5. With a socket wrench according to DIN 911 stud screws and/or cap head screws have to be tightened equally using the tightening torque stated in the table.
6. After a short operating time (0.5 to 1 hour) check tightening torque of the screws and correct if necessary.
7. In order to prevent the entering of foreign substances, fill empty connection bores with grease.

TAPER BUSHES, SCREW TIGHTENING TORQUE

Dimension	Wrench size	Number of screws	Tightening torque [Nm]
TB 1008, 1108	3	2	5.7
TB 1210, 1215, 1310, 1610, 1615	5	2	20.0
TB 2012	6	2	31.0
TB 2517	6	2	49.0
TB 3020, 3030	8	2	92.0
TB 3525, 3535	10	3	115.0
TB 4040	12	3	172.0
TB 4545	14	3	195.0
TB 5050	14	3	275.0

HORIZONTAL ALIGNMENT OF SHAFTS

Motor and drive shafts are to be aligned using a spirit level, if necessary.

Note!

Maximum shaft deviation 0.5°

VERTICAL ALIGNMENT OF THE V-GROOVED PULLEYS

The alignment of the V-grooved pulleys is checked before and after tightening the taper bushes with an alignment rail.

Note

Check whether the face widths of the V-grooved pulleys have the same sizes. A possible deviation of the face width has to be taken into account. With a symmetrical face set-up, the distance of the parallel, to the smaller face is half the deviation.

DESIGN SUPPORT

INSTALLATION AND MAINTENANCE SUPPORT

INITIAL INSTALLATION

Always install the V-belts without force. Installations using screw drivers, crowbars etc. cause external and internal damage to the belt. V-belts installed under force might only run for several days. A proper installation of the belt saves time and money.

If the installation space is too small, the V-grooved pulleys with belts should be slid onto the shafts.

BELT TENSION

Use belt tensioning values according to OPTIBELT recommendations. Set the belt tension with parallel motor and machine shafts. Operate the belt for some rotations and check the belt tension again. In our experience, belt tension should be checked again after an operating time of about 0.5 to 4 hours and then be corrected, if necessary.

For further information about belt tensioning see page 143/144.

* OPTIKRIK

ALLOWED SHAFT DEVIATION

After applying the initial installation tension, the distances X_1 , X_2 between the two pulleys d_{d1} , d_{d2} and the alignment rail on axis level should be measured, alternatively with the optibelt LASER POINTER. The maximum allowed values for the distance X from the table should not be exceeded, depending on the diameter d_d . Depending on the pulley diameter, the intermediate values for X should be interpolated.

Pulley diameter d_{d1} , d_{d2}	Maximum allowed deviation X_1 , X_2
112 mm	0.5 mm
224 mm	1.0 mm
450 mm	2.0 mm
630 mm	3.0 mm
900 mm	4.0 mm
1100 mm	5.0 mm
1400 mm	6.0 mm
1600 mm	7.0 mm

DRIVE CHECKING

We recommend checking the drive regularly, e.g. after each 3 to 6 months. V-grooved pulleys are to be checked for wear and consistency. Use the OPTIBELT profile and V-groove gauge tools.

When changing V-grooved pulleys with taper bushes (see fig. on page 152) the following aspects have to be observed:

1. Loosen all screws. Unscrew out one or two screws depending on the bush size, grease them and screw them into the set bores.
2. Tighten the screw or screws equally until the bush releases from the hub and the pulley can be moved freely on the shaft.
3. Remove the pulley with the bush from the shaft.

STORAGE

- **General note**

Properly stored V-belts retain their properties for many years (see also DIN 7716). However, when stored under adverse conditions or handled incorrectly, the physical properties of most rubber products will be impaired. This can be the consequence for example of the effects of oxygen, ozone, extreme temperatures, light, moisture or solvents.

- **Storage area**

The storage area should be dry and dust free. V-belts must not be stored close to chemicals, solvents, fuels, lubricants and acids etc.

- **Temperature**

V-belts should be stored at temperatures between +15 °C and +25 °C. Lower temperatures usually have no negative effect on the V-belts. However, since belts become very stiff at low temperatures, they should be warmed to approximately +20 °C before installation to avoid breaking and cracking.

Radiators and supply pipes should be screened. V-belts should be stored at least 1 m away from heat sources.

- **Light**

V-belts should be protected against light, especially direct sunlight and strong artificial light with high ultra-violet radiation (ozone formation) such as naked fluorescent tubes. Illumination using conventional bulbs is recommended.

- **Ozone**

In order to counteract the harmful effects of ozone, storages should not contain any appliances that generate ozone, e.g. fluorescent lights, mercury vapour lamps or high voltage electrical equipment. Combustion gases and vapours which could lead to the formation of ozone by photo-chemical processes must be avoided or eliminated.

- **Moisture**

Damp storage areas are unsuitable. Care must be taken to ensure that condensation does not develop. The most favourable relative air humidity is below 65%.

- **Proper storage**

Because stress can promote both permanent deformation and cracking, care must be taken to ensure that V-belts are stored without stress i.e. without tension, compression or any other form of pressure.

If V-belts have to be stored horizontally and stacked on top of each other, it is recommended that the stack height does not exceed 300 mm in order to avoid permanent deformation. If, in order to save space, V-belts are hung, the diameter of the cylinder on which the belts rest should be at least ten times the height of the belt profile.

optibelt S=C plus, optibelt SUPER E-POWER M=S, optibelt SUPER X-POWER M=S and optibelt SUPER TX M=S belts do not need to be stored in sets as they can be used in sets without measuring.

- **Cleaning**

Dirty V-belts can be cleaned using a 1:10 mixture of glycerine and methyl spirits or with brake cleaner. Petrol, benzene, turpentine and the like should not be used. In addition, sharp objects, wire brushes, emery paper etc. must be avoided under all circumstances, as these can cause damage to the belt.

DESIGN SUPPORT

LENGTH TOLERANCES AND CONVERSION FACTORS

Belt length measurement

The belt is placed over two identically sized measuring pulleys of the groove design shown in the following drawings. The dimensions are given in the tables 77 to 83 on pages 161/162.

By moving to the adjustable pulley the force Q is applied on the belt. Before measuring the drive centre distance a , the belt should be rotated three times under load. This ensures that the belt is well seated in the pulley, an essential pre-condition for the accuracy of the resulting measurement.

The length is obtained by adding the diameter of the pulley to twice the drive centre distance a .

$$L_d = 2 a + U_d$$

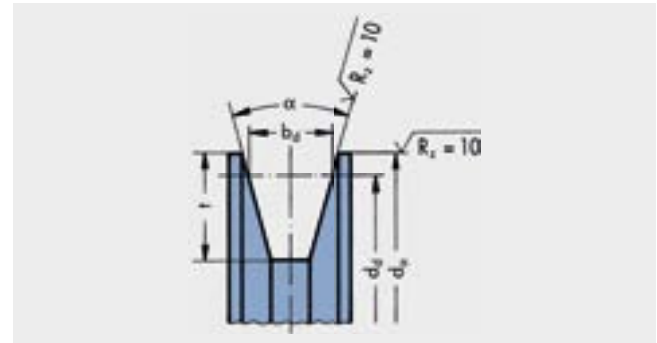

$$L_a = 2 a + U_a$$

Length conversion factors are given in the tables on pages 161/162 and 165/166.

CONVEYOR ELEMENTS

PRODUCT DESCRIPTION

OPTIBELT has developed a series of conveyor elements for the economical conveyance of goods in a varied range of applications.

- optibelt PKR endless V-belts DIN 2215 with patterned top surfaces
- optibelt PKR endless V-belts DIN 2215 with light coloured fabric cover and patterned top surfaces within the standard belt height
- optibelt KB kraftbands with patterned top surfaces
- optimat PKR open-ended V-belts DIN 2216 with patterned top surfaces
- optimat FK open-ended conveyor belts, punched
- optimax HF high performance flat belts

Construction/Quality

OPTIBELT conveyor elements consist of the basic belt and the top surface. These parts are specially connected via vulcanisation. The variety of applications required constructions with numerous patterns available in different qualities. Both pattern and surface quality should be adapted to the individual application.

Table 89

Type/Colour	Temperature resistance (°C)	Hardness (Shore A)	Oil resistance	Loss of colour
SBR-NR/light	-40 to + 70	55*/65**	no	no
CR/black	-25 to +100	≈ 65	limited	yes

CR/black is available as standard. We would be pleased to inform you about the production of the other constructions.

SBR = Styrene-Butadiene-Rubber

NR = Natural Rubber

CR = Chloroprene Rubber

* ≈ 55 for top surfaces above the standard height

** ≈ 65 for top surfaces within the standard height

Properties

Special surfaced belts are used instead of expensive conventional type conveyor belts. They run individually, or in sets arranged adjacent to each other, transporting goods horizontally, or inclined up or down. Vertical conveying is also possible if the belts are arranged top surface to top surface, gripping the goods between them.

Applications

Here are just a few examples of the wide range of applications in which OPTIBELT conveyor belts are used successfully.

For the conveyance of:

- doors, cupboard parts, veneer and plastic panels in the woodworking industry
- body parts and sharp-edged sheet metal in the automotive industry
- cardboard and boxes in the packaging industry
- roof tiles, concrete slabs and block paving stones
- flat glass
- postal items
- bowling balls on bowling lanes

In addition to the conveyance options, these belts are also used for

- labelling and sealing of tins and jars in the canning industry
- lifting, chopping and sorting of beet, potatoes, salad, cauliflower, Brussels sprouts and other vegetables in the agricultural industry

Due to their single belt characteristics and high surface load, OPTIBELT kraftbands with patterned top surfaces are especially suitable in conveyor systems and lifting platforms for:

- the conveyance of cargo containers
- loading and clearing of airplanes and railway wagons
- stowing and unloading of ship cargos

optibelt KB with top surface

CONVEYOR ELEMENTS

DESIGN GUIDELINES

Drive and guide pulleys

The drive and guide pulleys should be V-grooved pulleys. The minimum diameters should be selected according to the standard recommendations for V-belts and kraftbands. See the chapter on V-grooved pulleys. Due to the relatively low transporting speed (experience has shown that it is usually less than 1m/s) and the resulting low flex rate, pulley diameters can be reduced to approximately 10% below the recommended minimum. With greater reduction, there is danger that the top surface separates from the V-belt base. The driver pulley should be arranged at the discharge end of the conveyor so that the goods are pulled along.

Support idlers/tracks

In most cases, support idlers or tracks are required to prevent the belt from sagging under load. Support idlers may be flat faced or V-grooved pulleys. The dimensions of the pulley grooves should support the base of the conveyor belt in the base of the groove so only one edge can run on the groove flank, and thus cannot get stuck in the groove.

The diameter and the number of support idlers required depend on the length of the conveying span and the weight and size of the goods to be conveyed. Supporting tracks, generally made of plastic, are either flat or with a key seat to improve guidance of the conveyor belt. As with the support idlers, the grooves must have an adequate width.

Adjustment of the drive centre distance allowances

The tables on pages 82 to 84 show the drive centre distance allowances for special purpose conveyor belts and kraftbands.

Tensioning options

An adequate belt tension is essential to the reliable operation of the conveyor system. Tension is applied by adjusting the drive centre distance or, when the centres are fixed, by tension idlers.

When idlers are employed, they should be arranged inside the belt if possible, as otherwise the alternating flexing of the belt will reduce its service life.

optibelt RR round belts and optibelt KK plastic V-belts are especially suitable as conveyor elements in the food industry, ceramic industry, and for applications in contact with oil and chemicals. They can also be used as drive elements for specific capacity ranges. OPTIBELT supplies different qualities that can be easily distinguished due to their different colours.

Minimum lengths for endless connection:

 $d_{d2\ max}$ _____ mm $d_{a2\ max}$ _____ mm

Pulley face width $b_{2\ max}$ _____ mm

Speed ratio i _____

•Centre distance a _____ mm

Tension/guide pulleys: inside
 outside

d_d _____ mm V-pulley
 d_a _____ mm flat pulley

i_{min} _____ i_{max} _____

a_{min} _____ mm a_{max} _____ mm

in drive slack side
 in drive tight side

movable (e.g. spring loaded) _____
 fixed

Operating Conditions: Ambient temperature

_____ °C minimum
 _____ °C maximum

Exposure to oil
 water
 acid
 dust

* required
 • optional

(e.g. oil mist, droplets) _____
 (e.g. spray) _____
 (type, concentration, temperature) _____
 (type) _____

Special conditions: Where the drive is subjected to unusual conditions, e.g. inside or outside idler pulleys, 3- or multi-pulley drives, as well as drives with reverse rotational direction, drawings are required. Please use the back of this data sheet for sketches.

Details about the drive:

Details about the conveyor system:
