HYBRID HYDRAULIC SERIES

EHU

**EHU
2017**

EHU-R

SUT

ONE ORIGINAL MANY IMITATORS

Daikin Hybrid Power Unit series realized the world's first fusion of hydraulics technology with Daikin's exceptional air conditioning motor/inverter technology, and has been a trend setter for energy savings in the hydraulics field. Daikin's hybrid hydraulic series has now undergone a model change involving incorporating a highly efficient IPM motors in place of the SR motor. The significant improvement in energy savings and low heat generation contribute to greater plant energy savings. With a rare-earth permanent magnet deeply embedded in the rotor, the IPM motor uses an electromagnetic structure that maximizes magnetic torque (attractive & repulsive force between the coil and permanent magnet) and reluctance torque (force of the coil that attracts iron). This structure achieves high torque and maximum efficiency while suppressing heat generation. Combining two rotational forces, "magnetic torque" generated by a powerful neodymium magnet and "reluctance torque," generates more power with less electricity.

Many have tried to match Daikin's unique hybrid power unit design, but none have succeeded in price, efficiency, and interchangeability. The

Daikin Hybrid Power Unit series realized the world's first fusion of hydraulics technology with Daikin's exceptional air conditioning motor/inverter technology, and has been a trend setter for energy savings in the hydraulics field. Daikin's hybrid hydraulic series has now undergone a model change involving incorporating a highly efficient IPM motors in place of the SR motor. The significant improvement in energy savings and low heat generation contribute to greater plant energy savings. With a rare-earth permanent magnet deeply embedded in the rotor, the IPM motor uses an electromagnetic structure that maximizes magnetic torque (attractive & repulsive force between the coil and permanent magnet) and reluctance torque (force of the coil that attracts iron).

This structure achieves high torque and maximum

efficiency while

suppressing heat generation. Combining

two rotational forces,

"magnetic torque"

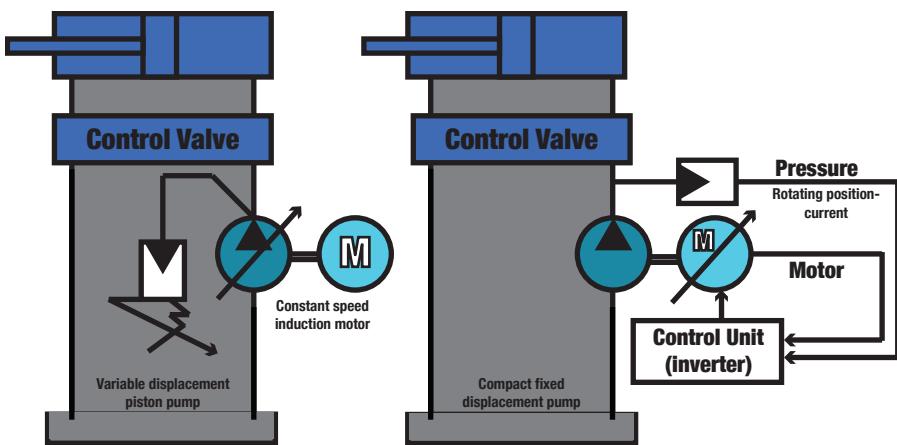

generated by a powerful

neodymium magnet

and "reluctance torque,"

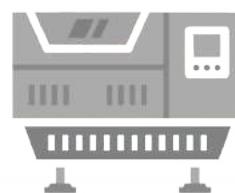

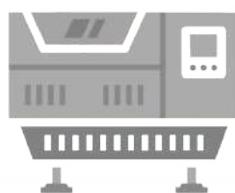

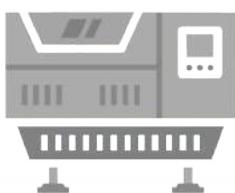

generates more power

with less electricity.

*Conventional Unit vs. Daikin Inverter Unit

On a standard machining center or lathe, hydraulics consume 20-30% of the entire machine center's energy consumption. The heat generation and tank dump waste of hydraulic units greatly contribute to the excessive operational costs and performance issues that continue to trouble users. Through their unique design, Daikin Hybrid Hydraulic Power Units provides five major factors that put money back into the pockets of manufacturing companies faced with the costs of daily operations. Ultimately this reduction in energy, heat, oil, noise, and stock creates instant cost savings; enough that the units can pay for itself in as little as 12 months of operation.

ENERGY Lower energy consumption through advanced inverter technology provides longer unit life, reduced energy cost, and sustainable savings. Average reduction of 60-70%.

HEAT A reduction of heat generation creates longer life for machine components and reduces ambient workspace temperatures, resulting in reduced air conditioning demand and fewer opportunities for overheating. Average reduction from 104°F to 70°F.

OIL Conventional hydraulic units require larger capacity tanks to dissipate heat than Daikin power units, which reduce oil disposal. Average reduction of 33-80%.

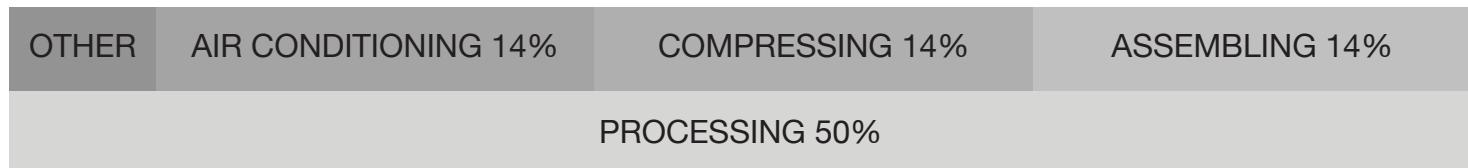

NOISE Noise reduction creates a more comfortable and safe work environment, reducing worry and cutting cost on factory alarms. Average reduction from 75 dBA to 50 dBA.

STOCK Compatibility and adaptability creates less need for on-hand stock, as Daikin power units work as a drop-in replacement for the vast majority of hydraulic pumps and motors within the industrial marketplace.

POWER UNIT ENERGY CONSUMPTION

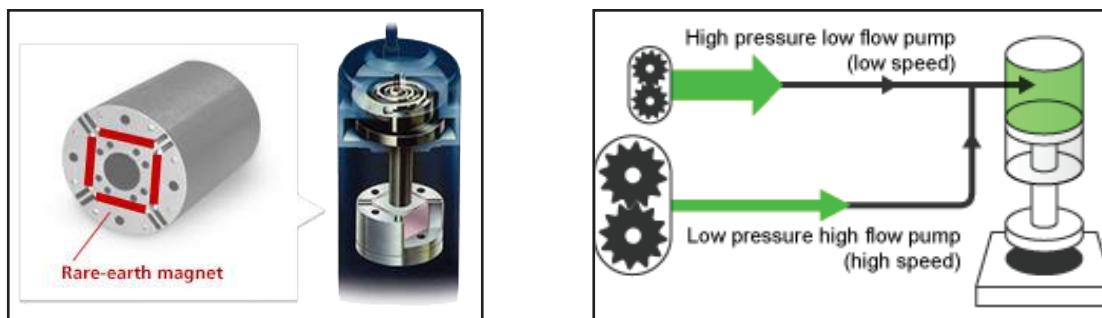

Reviewing energy saving options in machining facilities is crucial to protect environment and improve productivity. On a standard production line, up to 50% of all power consumed comes from the processing portion of the operation. This is the highest of all power consumer factors a product line faces.

Whereas most companies identify opportunities to improve productivity, reduce waste, and save energy through updates around their plant, not many focus on the actual production cycle of their machines. Daikin Industries Ltd. has chosen to focus on the process lines in a factory where 45% energy is generally consumed. Most of the fixed consumption consists of the hydraulic unit, oil cooling, and coolant pump. Daikin's unique oil hydraulic systems, which seamlessly integrates oil hydraulic control and inverter motor technologies, are able to reduce power consumption significantly. This advanced, specially-designed motor is patented and manufactured by Daikin Industries and is found in no other power unit available. A rare-earth permanent magnet deeply positioned in the rotor can generate magnet torque (attraction & repelence between coil and permanent magnet) and reluctance torque (coil attracts iron). This electromagnetic structure attains high torque, highest efficiency, and low heat generation.

Daikin hydraulic systems also feature an autonomous select fixed double pump to achieve great energy savings. Flow combining/dividing selection can be independently controlled according to load pressure with a fixed displacement double pump (high and low) and selector. If high speed is needed, two high and low displacement pumps are combined to rotate at high speed to discharge at a higher flow rate. When the pressure is retained, only the low-displacement pump is selected to operate at low speed to achieve energy-savings and a much lower heat to noise ratio. By monitoring pressure of each control axis from three to six, the high speed motor can also provide an idle stop function. Many of Daikin's direct competitors create energy savings by a complete shut-off of their system when not in use. This creates serious wear and tear over a period of time and can often be more inefficient when the machine it is installed into runs continuously. This idling function ensures maximum energy-savings by slowing the motor automatically when the required output pressure is obtained, retaining just enough pressure for the system to kick back into use when next called upon.

Complete idling is also available by giving simple DC 24V signal to the power unit. Controller stays on during idle stop so to prevent damage to the electrical circuit from repeated force shut-off.

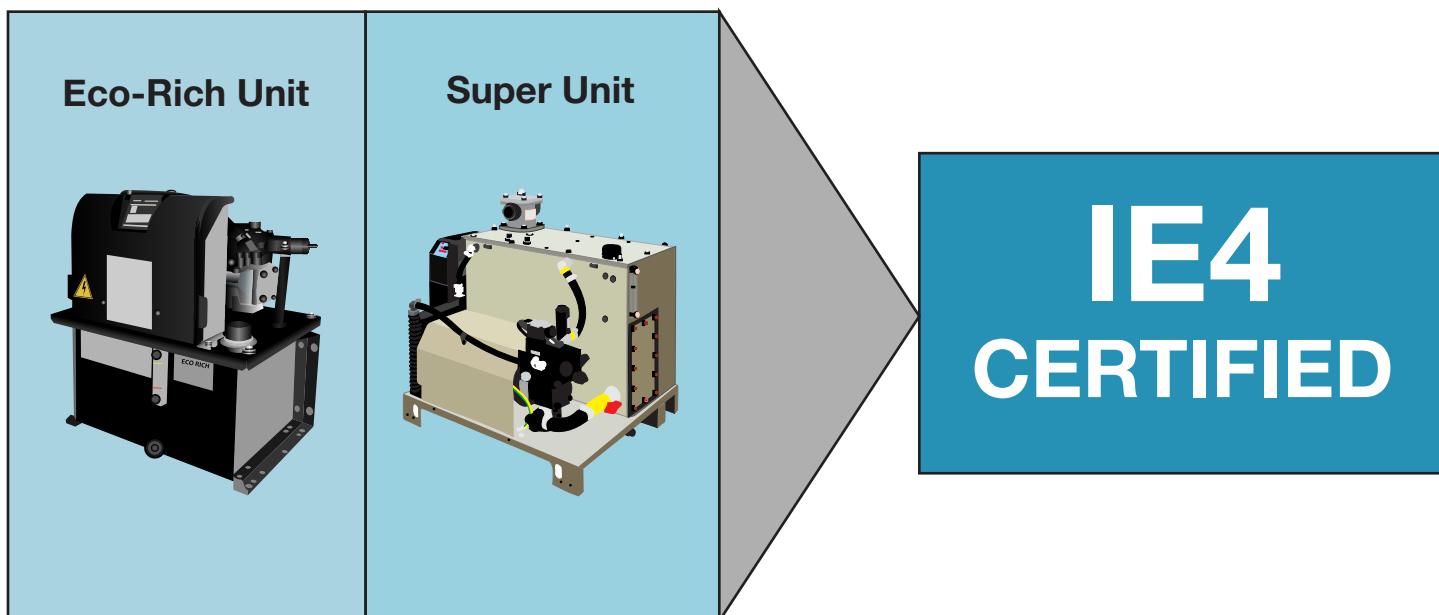

In 2009, IE2 (high efficiency) standards were introduced to the United States. The same laws came into effect in Europe and China in 2013. Today, all countries have introduced IE3 (premium efficiency) standards which regulates efficiency of motors in the power range of 0.75kW and above.

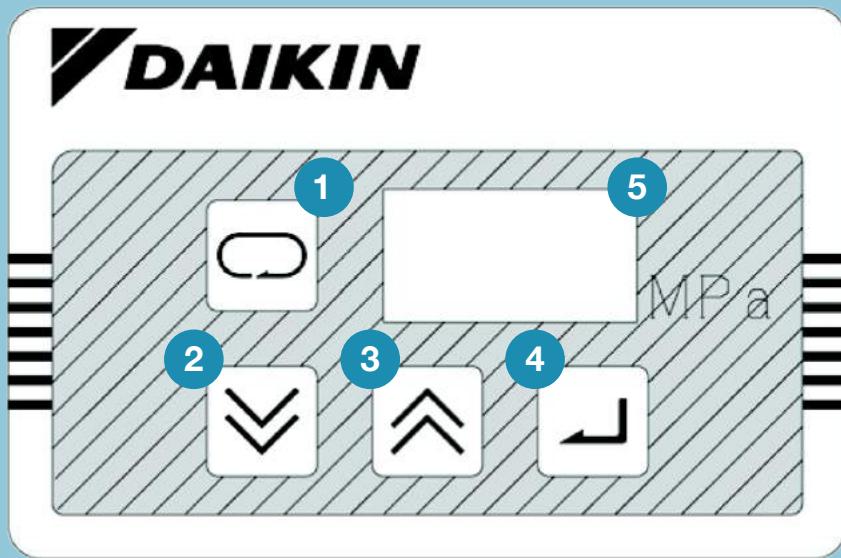

The IE-code and its efficiency levels create a basic vocabulary for governments to determine the efficiency level for their Minimum Energy Performance Standards (MEPS). The European Union set motor MEPS levels (Directive 640/2009) at IE3 (or IE2 in combination with a variable frequency drive) in 2015 for smaller motors and in 2017 covering larger motors. In 1997 (Energy Policy Act) the minimum required level was set at the equivalent of IE2. In 2007 (Energy Independence and Security Act)

MEPS were raised to the equivalent of the IE3 level (NEMA Premium). NEMA Premium and IE3 are coordinated as efficiency levels, the USA currently recognizes in its legal requirements the national testing standard IEEE 112B and the Canadian test standard CSA390 but not yet the IEC test Standard IEC 60034-2-1 (the differences are minimal). Therefore most motors used on machines need to be IE3 level.

Even today, with the IE3 regulations in place, there are hydraulic companies that are producing motors that are not compliant by law. If you're looking to upgrade your motor, you can rest assured knowing that Daikin Hybrid Hydraulics Power Units meet and exceed these standards.

Daikin Hybrid Hydraulics embody the most innovative and adaptable technology available today and provide users with options that provide savings far beyond what conventional units can offer.

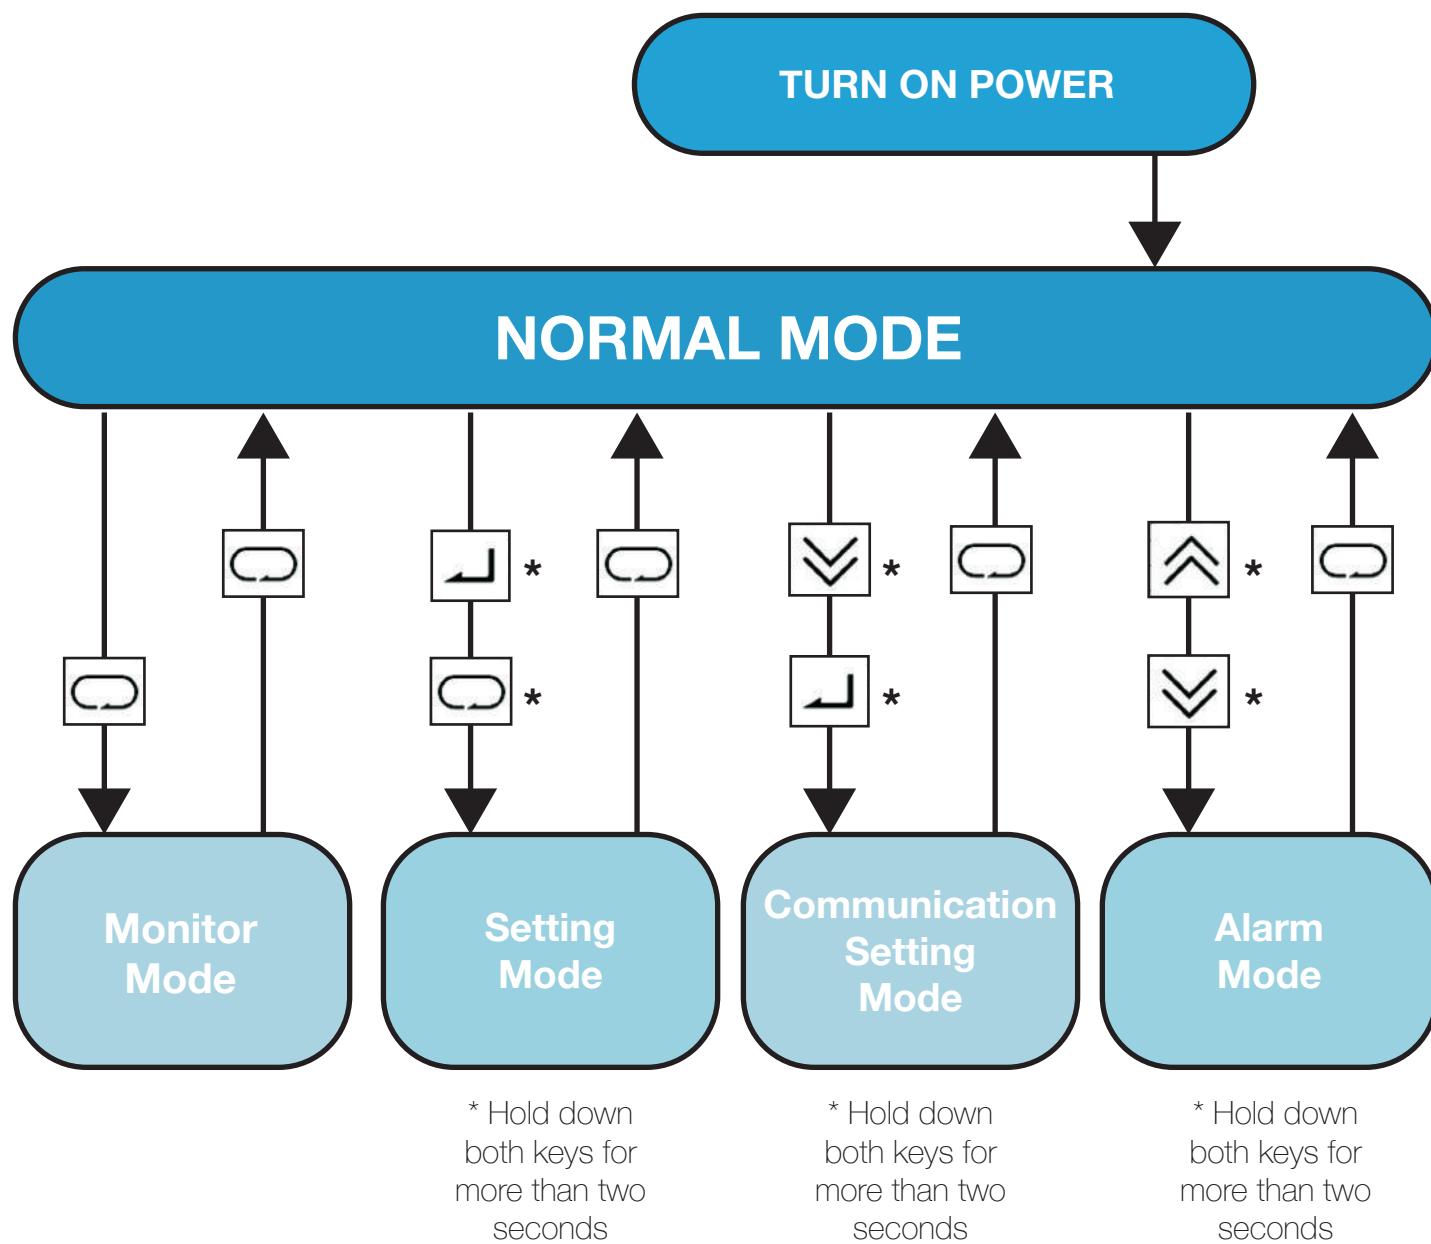

NO.	ITEM	DESCRIPTION
1	[MODE] key	Selects the operation mode.
2	[DOWN] key	Decrements a value set for the operation mode/monitor mode/data.
3	[UP] key	Increments a value set for the operation mode/monitor more/data.
4	[ENT] key	Confirms the edited operation mode/monitor mode/data.
5	Data Display	<p>Normal mode: Displays the actual pressure or alarm code.</p> <p>Monitor mode: Displays the pressure switch setting, each pressure setting, each flow rate setting, the actual flow rate, or the actual rotation speed.</p> <p>Setting mode: Set or change the pressure, flow rate, or other parameters.</p> <p>Alarm mode: Check the alarm history.</p> <p>Communication setting mode: Change communication settings.</p>

Daikin Hybrid Hydraulic Power Units are the only cost-effective units in the world that can be adjusted through an easy-to-use keypad design located on the front of the unit. The keypad serves a diagnostic tool that lets the user manually adjust pressure and flow settings on each machine for unparalleled efficiency.

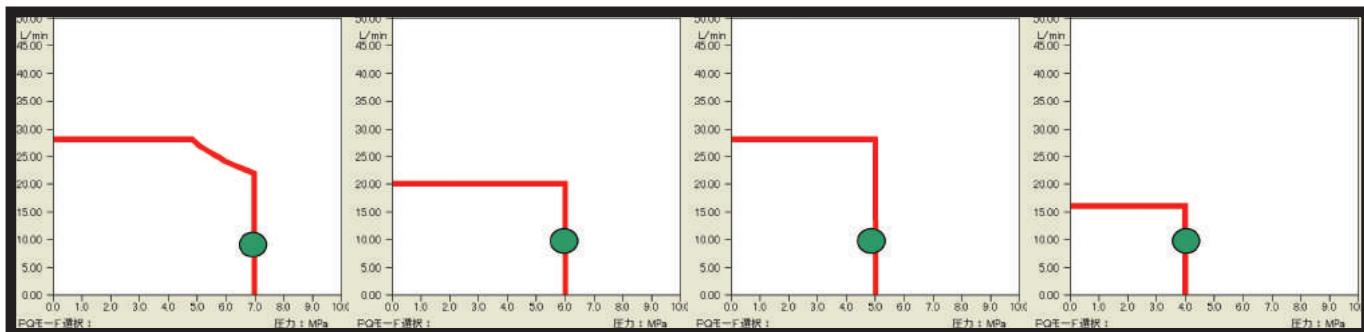

Previous and potential failures are easy to monitor through the use of the keypad as a diagnostic tool. The keypad monitors common (N) parameters and uses smart technology to alert the user of any problems or failures. The unit will even shut itself off if a catastrophic failure occurs, drastically reducing maintenance times.

**16
PQ**

MULTI-STAGE PRESSURE & FLOW RATE CONTROL (16 PQ)

The force (pressure) and speed (flow rate) of the actuator (cylinder) can be controlled with 16 pressure (P) and flow rate (Q) setting patterns. Pressure control valves and proportional flow control valves, which are utilized in conventional actuator circuits, are not required. Once the pressure and flow rate have been set at the controller's operation panel, you can select 16 preset patterns using external input signals. Daikin Hybrid Hydraulic Power Units autonomously change the control mode from flow rate control to pressure control (example: flow rate control is changed to pressure control at the cylinder stroke end). The solenoid valve that actuates the cylinder must be turned ON/OFF at the machine. "Shockless control" is the result of smooth changing of force (pressure) and speed (flow rate). Once acceleration time and deceleration time parameters are registered, the force or speed can be changed gradually during a pressure/flow rate setting change.

**C**

COMMUNICATION FUNCTION

Hybrid hydraulics can be remotely controlled from PLC interface of your machine. This function eliminates complicated individual operations and installation space limitations. Enabling remote operation to change the operation conditions setting of the hybrid unit. Various settings such as acceleration & deceleration time and pressure switch settings, as well as the pressure and flow rate, can be set remotely. This makes it possible to control the hydraulic pressure operating conditions in synchrony with the control of the machine.

The capability to read the operating conditions of the hybrid units makes it possible to display information, such as the current pressure and flow rate on the screen, at the machine. A hydraulic control system for machinery that requires variable speed control or continuity of pressurizing forces can be realized with a simple configuration. A joystick or trimmer can be connected for real-time control (only for analog control models). The serial communication interface conforms to the RS232C standard (RS485 option available). Prepare a control unit such as a PLC or touch panel display with the RS232C communication function happens at the machine side.

**HYB
WIN**

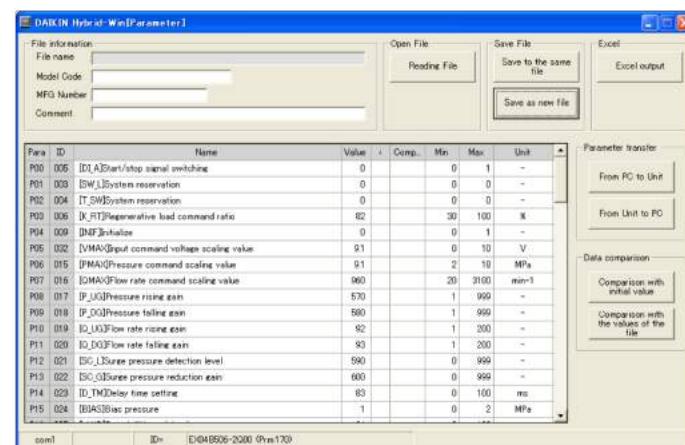

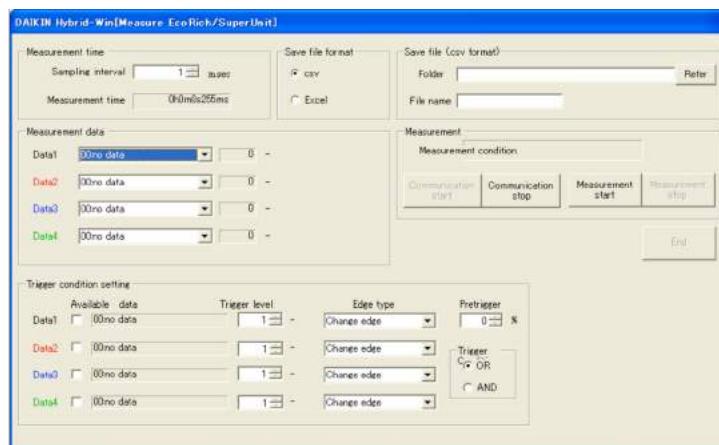

HYBRID-WIN PROGRAMMING

Hybrid-Win is utility software to monitor the internal status of Daikin hybrid systems using a PC. The software and its instruction manual can be downloaded from Daikin's website free of charge by completing the user registration process. This PC utility reads data from Daikin hybrid systems and manages it. Parameter setting and monitoring can be accomplished efficiently using the Windows application. Special cables are required.

The pressure, flow rate, and other internal data of the inverter controller are monitored and displayed in the form of graphs. This facilitates operation checks during test runs, adjustments of parameters, and troubleshooting.

The time required for set-up can be slashed by editing the parameter settings on the PC and writing them to the unit in a batch. The ability to read and save settings eases management. To speed up your readings, you can program the software to save the alarm history. This function enables quick identification of the parts that require maintenance and reduction of the downtime. The operating time display can serve as the guide for the timing to replace consumable parts or to conduct maintenance. Troubleshooting information including the diagnosis results of the cause of an alarm and action to take can be displayed.

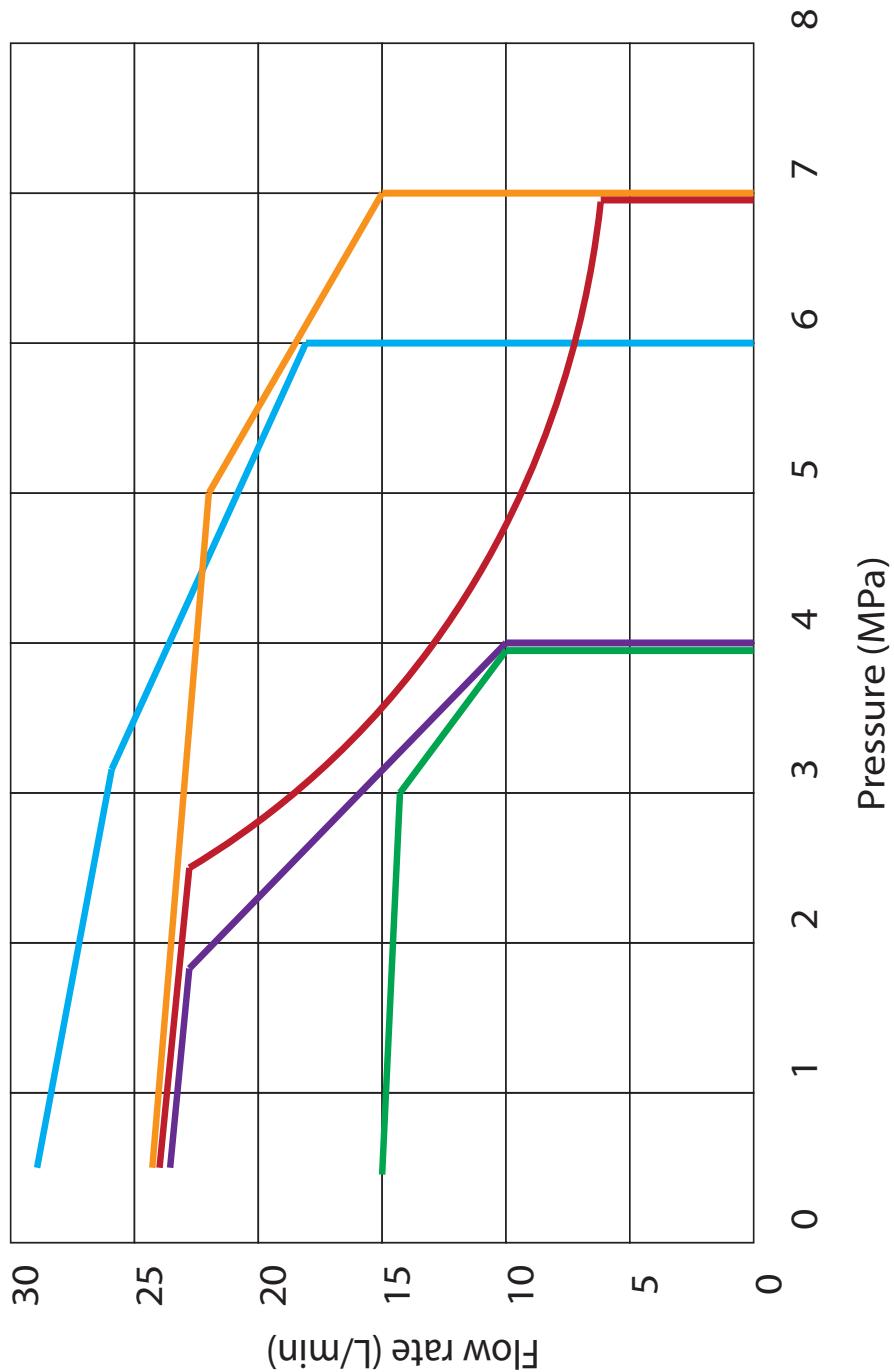

A

ANALOG COMMAND INPUT

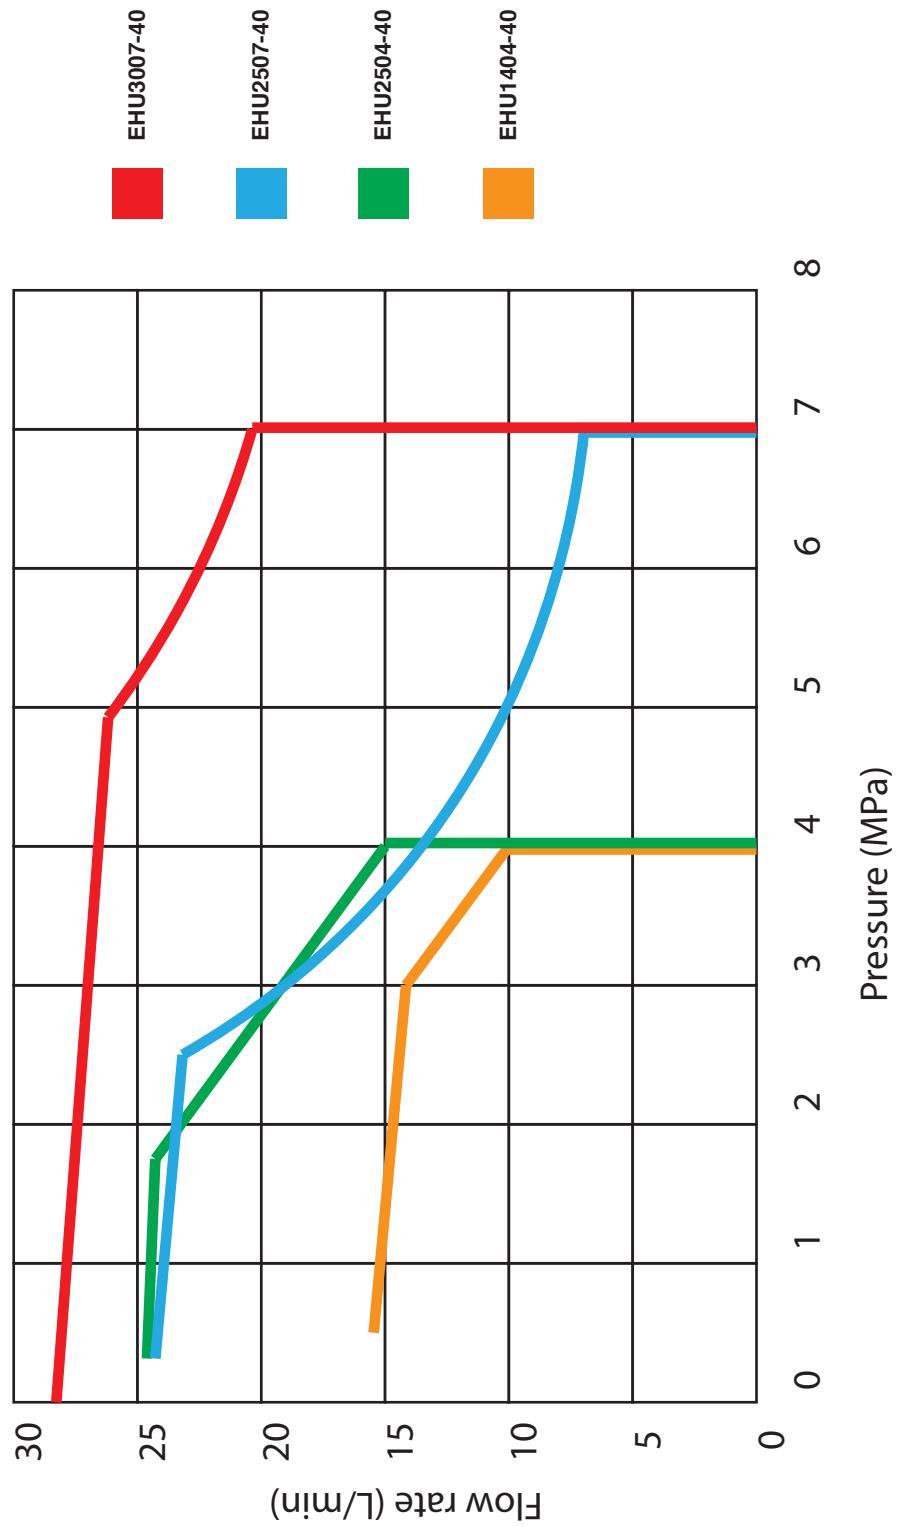

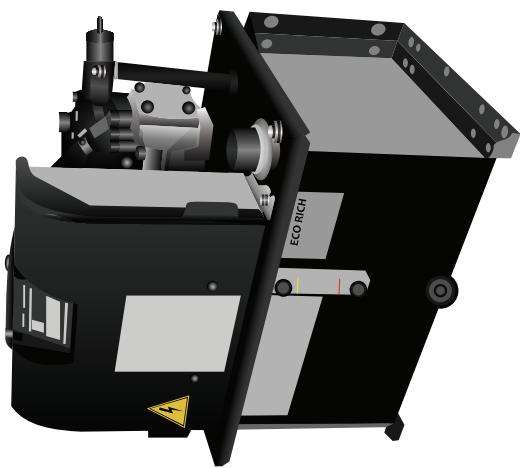

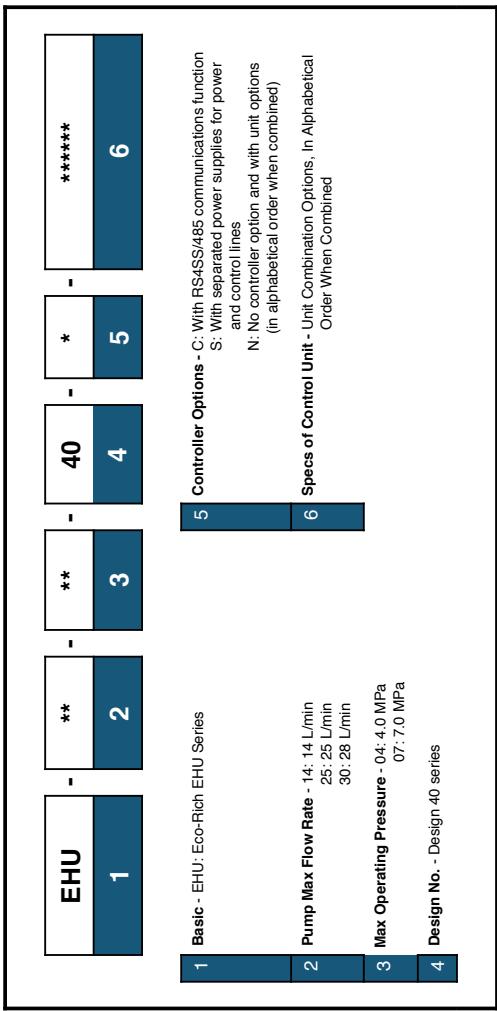

The capability to specify the pressure and flow rate with voltage ranging from 0 to 10 V enables continuous hydraulic control as required. Real-time variation in response to commands facilitates condition settings at the machine side. A hydraulic control system for machinery that requires variable speed control or continuity of pressurizing forces can be realized with a simple configuration. A joystick or trimmer can be connected for real-time control.

COREPULL

HYDRAULIC POWER PACKS

FOR ELECTRIC INJECTION MOLDING MACHINES

- EHU-30R or SUT Core Hydraulics
- 63% Energy Savings
- Servo Driven Hydraulics
- Energy Myser Control System
- No Cooling Water Required
- 1-4 Core Capacity
- Standard or Custom

The advent of the electronic age brought industry more efficient plastic injection machines. All World's COREPULL system is the hydraulic package to match energy efficiencies demands. This HPU breaks from conventional core-pull units by using a fixed-displacement pump and variable-speed electric drive to match pump output to load demand. The control box at right houses electronic controls for interfacing with an injection molding machine's core-pull system and on-board pressure transducer, the motor accelerates to full speed in 0.1 second. All World's Electric Injection Molding Machines Hydraulic Power Packs rest on four swivel wheels for mobility and adaptability. Remote mounted keypad, Econo J-Box, and Super-Shot accumulator are all available as a-la-carte options for further versatility!

All World's Core Pull units are the leading plastic injection molding industry leader in hydraulic power packs with over 2,000 units sold nationwide. Our systems are used by top OEMs in the U.S.A. and Japan.

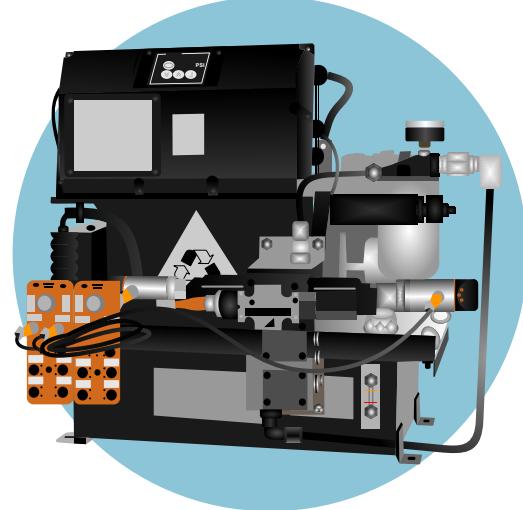

CLAMPMAX

HYDRAULIC POWER PACKS

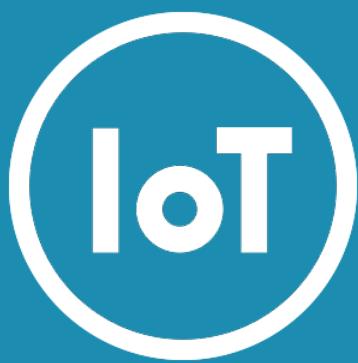

FOR WORKHOLDING & CLAMPING SYSTEMS

- EHU Core Hydraulics (Up to 5,000 PSI)
- SUT Core Hydraulics (Up to 3,000 PSI)
- Minimal Leakage Potential
- Utilizes IFM Digital Pressure Switches
- Extremely Safe Operation
- Intensified or Non-intensified
- Standard or Custom

All World's CLAMPMAX is available in many packages and configurations to meet your clamping or workholding application's biggest challenges. IFM devices are IoT-ready and eliminate costly building, labor, and maintenance costs. Up to six valve packages available. Clamp monitoring options allow pressure monitoring of A, B, or both A/B line circuits. Units that use intensifier packages are built using an in-stack booster underneath the hydraulic valve, reducing what is intensified to just the A port to minimizes damage/leakage potential. An inline pressure 10 micron filter is built into every intensified system to ensure clean oil goes out to the machine circuit. The hybrid controller's handle of motor speed eliminates concern for over-speeding and damaging the intensifier. Non-intensified models are also available. Custom options are nearly limitless!

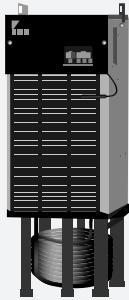

All World has partnered with Daikin Industries and IFM Electronics to bring the most user-friendly, network-smart hybrid hydraulic technology to North America's industrial market space. This power pack is just the beginning.

UNPARALLELED ENERGY SAVINGS AND TECHNOLOGY

Today's industrial machinery and machine tools heat up quickly, as they are constantly in motion and tend to run at a higher speed of spindles for precise processing. Many component applications require constant cooling to prevent deviation and inefficiencies in operation. Luckily, Daikin Industries has a cooling solution for every cooling application in industry. Daikin Hybrid Oil Coolers provide premium energy savings with unsurpassed technology for all cooling types: oil, lubricants, water, hydraulic fluids, and cutting fluids. Installed in each cooling unit is Daikin's patented IPM motor, which uses a rare-earth magnet to minimize thermal displacement of the tooling, provides stable actuation of the actuator, and prevents rising motor coil temperatures, and extends life and accuracy. Each unit is built tough to withstand the severe condition of factory dust and mist and are compliant with energy regulations in Asia, Europe, and Oceania.

	With Breaker	CE Compliant	With Heater	With Tank	Different Voltages	With Pump
AKZ SERIES	●	●	●	●	●	
AKJ SERIES	●	●	●		●	
AKC SERIES		●	●			●
AKW SERIES	●	●	●		●	

ENERGY Lower energy consumption through advanced IPM motor technology inside the compressor and R410A refrigerant for high COP characteristics. Other features include low-noise reduced in-line with load reduction and measurable power consumption that can also be monitored from the operations panel. These features provide longer unit life, reduced energy cost, and sustainable savings.

TEMPERATURE CONTROL Daikin Oil Coolers embody a further evolution of high-accuracy temperature control. Precise oil temperatures accuracies differ by only $\pm 0.18^{\circ}\text{F}$ ($\pm 0.1^{\circ}\text{C}$) at a wide range of use. The cooling capacity resolution in the low-load range has been improved through optimal control of the compressor and electronic expansion valve.

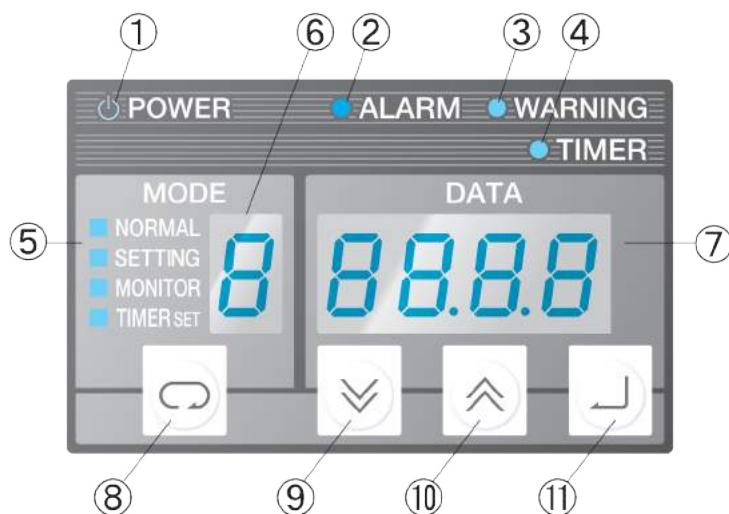

ALARM FUNCTIONS Built-in advanced technology includes several state-of-the-art features to provide proper maintenance support for your unit including, a refrigerant gas leakage detection alarm function, an oil temperature warning function, an auto-tuning function, a 999-hour timer function, and a preventative maintenance function that notifies the operator when the air filter or condenser is clogged.

COMPATIBILITY Daikin Oil Coolers offer a variety of solutions for machine tool systems. Replacing an existing unit with a Daikin hybrid unit works in nearly 90% of standard industrial applications, helping reduce need for additional on-hand stock.

Oil Tank Capacity (G)																				
Notes:																				

¹The cooling capacity indicates the value at the standard point, tank fluid temperature: 35°C, room temperature: 35°C, fluid used: ISO VG32. This unit has about ±5% of product tolerance.

²Use a commercial power supply for the power source. The use of a private power supply may cause damage to the machine. The voltage fluctuation range should be within ±1%. If it is more than ±10%, please consult us.

³There are three different types of synchronization depending on the power source -0.6-, -0.7- and -0.8- units deal with the different voltage by reading a transformer. The main circuit voltage is the transformer's secondary side voltage of AC 200 V / 50/60 Hz.

⁴The machine temperature synchronization is available as an option on the power source -0.6-, -0.7- and -0.8- units deal with the different voltage by reading a transformer. (Refer to page L-57 for details.)

⁵Electric circuit breaker (overcurrent protection). IP65 On request (above 1000A) see page L-57 for details.

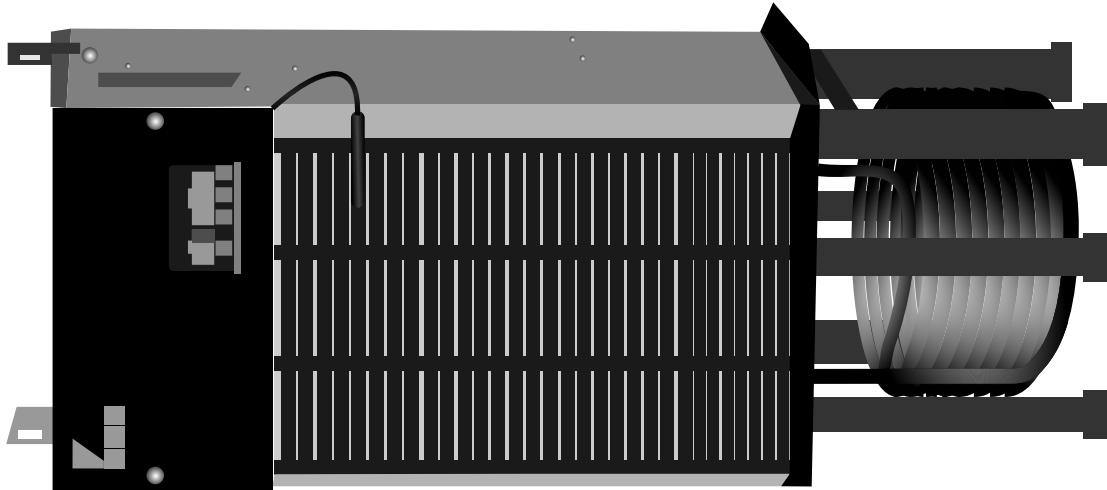

⁶The specifications for permissible transportation vibration are those of a standard unit.

⁷The model indicates that the circuit breaker is not supplied with its product. Please inquire if you need one.

⁸The yellow line on the tank oil level gauge shows the highest oil level and the red line the lowest oil level.

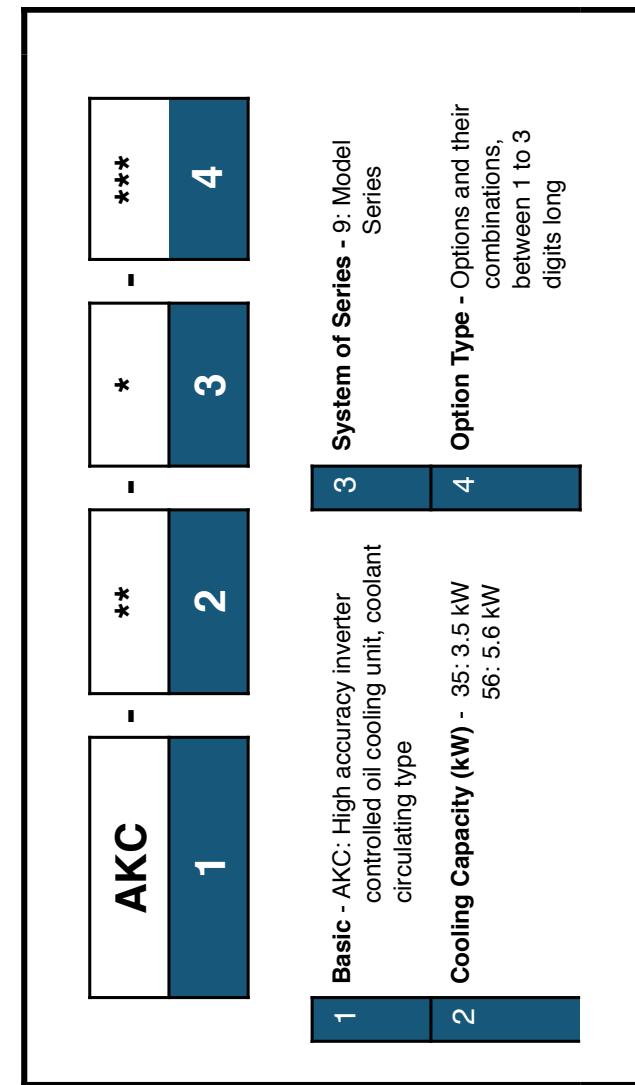

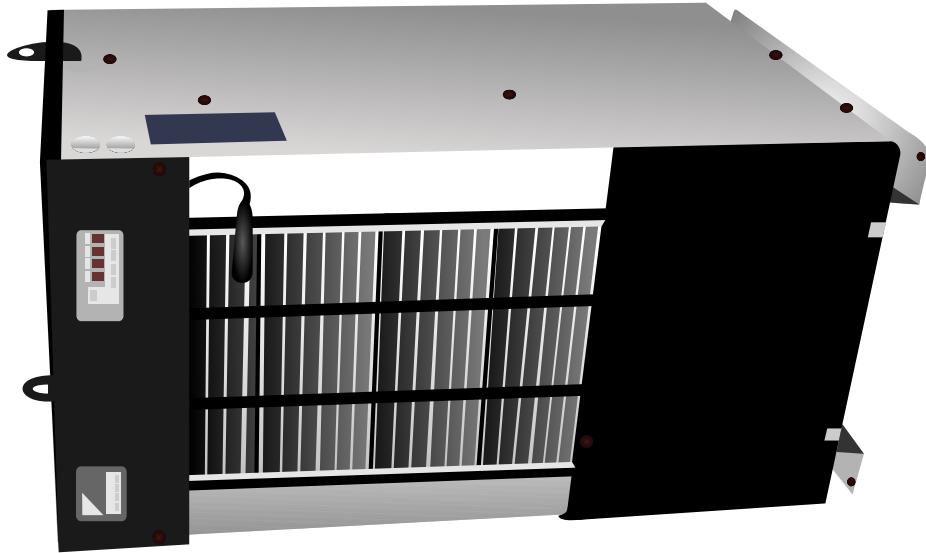

⁹The maximum power consumption/maximum current consumption of different voltage specifications are shown in the tables below.

AKJ SERIES

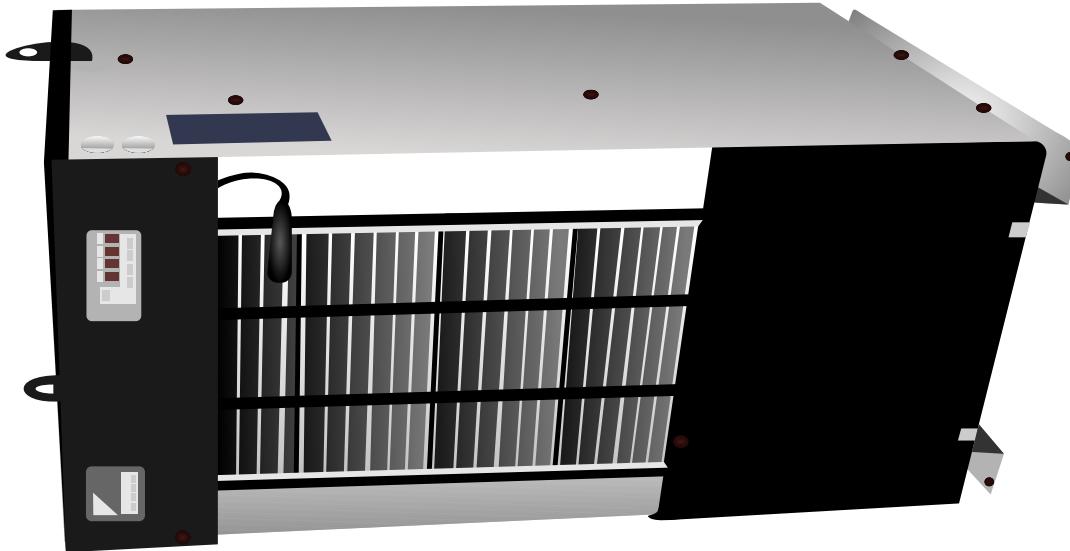

AKJ	-	**	-	2	-	*	-	3	-	***	-	4
System of Series - 9: Model Series												
1	Basic - AKJ: High precision inverter units, immersion types, for cutting/ grinding fluid	3	Option Type - Options and their combinations, between 1 to 3 digits long									
2	Cooling Capacity (kW) - 18: 1.8 kW 35: 3.5 kW 45: 4.5 kW 56: 5.6 kW 90: 9.0 kW 150: 15.0 kW	4										

AKC SERIES

Model	AKC359			AKC569				
Horsepower (HP)	1.2				2.0			
Model Type	Standard	-C (CE Compliant Type)	-H (With Heater)	-200 (With Pump)	Standard	-C (CE Compliant Type)		
Cooling Capacity (50/60 Hz kW)	3.5/3.5			3.2/3.2		5.6/5.6		
Heater	-	1	-	-	-	2		
Power Supply 2	Three-phase AC 200/200-220 V 50/60Hz			Three-phase AC 200/200-220 V 50/60Hz				
Power Voltage	Main Circuit 3	Three-phase AC 200/200-220 V 50/60Hz			DC12/24 V			
	Operation Circuit	DC12/24 V						
Max Power & Current Consumption	200 V 50 Hz 200 V 60 Hz 220 V 60 Hz	1.71 kW/4.2 A 1.22 kW/4.3 A 1.21 kW/4.1 A	1.44 kW/5.3 A 1.60 kW/5.5 A 1.60 kW/5.2 A	1.78 kW/6.2 A 1.87 kW/6.3 A 1.88 kW/6.1 A	2.34 kW/7.0 A *3 2.34 kW/7.0 A *3 2.81 kW/7.6 A *3	2.10 kW/7.4 A 2.30 kW/7.6 A 2.30 kW/7.3 A		
External Dimensions HxWxD (In.)	39 x 18 x 22			47 x 19 x 26				
Compressor	Equivalent to 0.75 kW			Equivalent to 1.5 kW				
Pump	Motor Total Head (50/50 Hz)	- -	0.4 kW x 4-pole motor 10/15 m	- -	0.4 kW x 4-pole motor 10/15 m	0.4 kW x 4-pole motor 10/15 m		
Suction Lift	-	-	0.5 m *4	-	-	0.5 m *4		
Temperature Control (Selectable)	Standard Controlled Object	Synchronization Type: Room Temperature or Machine Temperature *4 (Set to room temperature by default)			Synchronization Type: Fluid Inlet Temperature or Fluid Outlet Temperature (Set to fluid inlet temperature by default)			
Synchronization Range (K)	Synchronization Type: -9 to +9 against the standard temperature (Set at 0.0 by default)			Synchronization Type: -9 to +9 against the standard temperature (Set at 0.0 by default)				
Controlled Object	Fixed Type: Fluid Inlet Temperature or Fluid Outlet Temperature			Fixed Type: Fluid Inlet Temperature or Fluid Outlet Temperature				
Range (°F)	Range (°F): 41 to 122 (5 to 50 °C)			Range (°F): 41 to 122 (5 to 50 °C)				
Refrigerant (R410A)*5 Filling Volume (lbs)	1.77 (0.80 kg)			2.76 (1.25 kg)				
Protection Devices	A set of overcurrent relay (for a pump motor), discharge pipe temperature thermostat, condenser temperature thermostat, reverse-phase protection device, restart prevention timer, low room temperature protection thermostat, high fluid temperature protection thermostat, low fluid temperature protection thermostat, refrigerant leakage detector, evaporator clogging detection (intake pipe temperature thermostat), inverter protection device, circuit breaker, temperature fuse (-H type only), overheat prevention temperature switch (-H type only), high pressure switch (-C type only), and compressor thermal protector (-C type only)							
Operation Range	Room Temperature (°F)	41 to 113 (5 to 45 °C)			41 to 113 (5 to 45 °C)			
	Fluid Inlet Temperature (°F)	41 to 122 (5 to 50 °C)			41 to 122 (5 to 50 °C)			
	Fluid Viscosity (cP)	0.31 maximum (200 mm ² maximum [water soluble to ISO VG32])			0.31 maximum (200 mm ² maximum [water soluble to ISO VG32])			
	Withstanding Pressure (PSI)	29 (0.2 MPa)			29 (0.2 MPa)			
	Rated Circulating Volume (G/Min)	9.25 (35 L/min)			9.25 (35 L/min)			
	Circulating Volume (G/min)	4 minimum (15 L/min minimum)			4 minimum (15 L/min minimum)			
Acceptable Fluids	Lubrication oil, hydraulic oil, cutting oil, (water based) coolant, (grinding oil *8) (Use clean fluid that can pass through filter equipment with a screen mesh of 40 or greater.)							
Noise Level dB (A)	62			65				
Mass (lbs)	183 (83 kg)	190 (86 kg)	232 (105 kg)	220 (100 kg)	234 (106 kg)	269 (122 kg)		
Notes:	<p>*1 The cooling capacity indicates the value at the standard point (fluid inlet temperature: 35°C, room temperature: 35°C, fluid used: ISO VG32, flow rate: rated circulating volume). This unit has about ±5% of product tolerance.</p> <p>*2 Use a commercial power supply for the power source. The use of an inverter power supply may cause burn damage to the machine. The voltage fluctuation range should be within ±10%. If it is more than ±10%, please consult us.</p> <p>*3 The maximum power consumption/maximum current consumption indicates the value when heating fluid with the heater. The values when cooling fluid with the cooler are the same as with the standard models.</p> <p>*4 Indicates the maximum value with clean fresh water.</p> <p>*5 The optional thermistor for machine temperature synchronization is required.</p> <p>*6 The -C type comes with the refrigerant R410A SDS (Safety Data Sheet).</p> <p>*7 Use with water, chemicals, food or oils is not possible.</p> <p>*8 If the unit is used for a grinding machine or similar equipment, the evaporator tends to become clogged with foreign material, necessitating frequent maintenance of the evaporator or a considerably shorter pump service life due to wear of the pump parts (mainly the mechanical seals).</p> <p>*9 Not applicable to models without a pump.</p> <p>*10 The rotational speed of the fan varies depending on the room temperature to conserve energy. Therefore, it is normal for the noise level to vary accordingly.</p> <p>*11 Ingress protection for switch box: equivalent to IP54 (When wired with IP54 or higher conduit tube or other protection on the wiring port.)</p>							

AKW SERIES
