Proper use results in power saving

If the air filter is clogged, the cooling performance deteriorates, causing excess power consumption.
Clean the air filter periodically to reduce power consumption.

Thank you for purchasing DAIKIN Oil Cooling Unit (“OILCON”). This instruction manual includes instructions for using the Oil Cooling Unit.
To ensure proper use of this product, be sure to read through this instruction manual before using it.

After reading this manual, keep it handy for your future reference.

CE compliance declaration

If the air filter is clogged, the cooling performance deteriorates, causing excess power consumption.
Clean the air filter periodically to reduce power consumption.
Safety Precautions

Before using this product, read the following instructions carefully to ensure proper use.

The instructions described below are intended to prevent injury or damage to you and other people.
Possible conditions that may result from improper handling are classified as follows:

### DANGER
This category indicates urgently hazardous conditions that may result in death or serious injury.

- Mandatory

### WARNING
This category indicates potentially hazardous conditions that may result in death or serious injury.

- Mandatory

### CAUTION
This category indicates potentially hazardous conditions that may result in injury or property damage only.

- Mandatory

All these instructions include important information on safety. Be sure to observe the instructions.
- Mandatory

After reading this manual, be sure to keep it in place so that users can read it whenever required.
- Mandatory

If this product is transferred to another person, be sure to attach this manual to the product.
- Mandatory

To use this product safely, be sure to observe the following instructions, and safety laws and regulations for the relevant standards listed below.

1. Industrial Safety and Health Law
2. Fire Service Law
3. JIS B8361 General Rules for Hydraulic Systems

### Precautions for installation

#### DANGER

**Only qualified people can handle the unit.**

- Mandatory

Transportation, installation, piping, electric wiring, operation, maintenance and inspection of the unit must be conducted by qualified people. Check the power supply (voltage, frequency and current).

**Connect the power cable according to the procedure described in this instruction manual.**

- Forbidden

Connect the power cable according to the procedure described in “Electric Wiring” on page 8.

**Check the weight, and hang the unit by the specified points.**

- Mandatory

Check the weight of the unit with the nameplate to make sure that it does not exceed the rated load capacity of the carrier. Hang the unit by the points specified in the outline drawing. Failure to observe this instruction may result in fall or overturn of the unit, causing injury or property damage.

**Ground the unit securely.**

- Mandatory

If the unit is not grounded, you may get an electric shock.

**Connect the power cable according to the procedure described in this instruction manual.**

- Forbidden

Connect the power cable according to the procedure described in “Electric Wiring” on page 8.

**Check the weight, and hang the unit by the specified points.**

- Mandatory

Check the weight of the unit with the nameplate to make sure that it does not exceed the rated load capacity of the carrier. Hang the unit by the points specified in the outline drawing. Failure to observe this instruction may result in fall or overturn of the unit, causing injury or property damage.

**Ground the unit securely.**

- Mandatory

If the unit is not grounded, you may get an electric shock.

#### WARNING

**Conduct electric wiring according to the ratings.**

- Mandatory

Conduct electric wiring according to “Regulation on Electrical Facilities” and “Internal Wiring Regulations”. Improper wiring may result in burnout or fire. For overseas use, conduct electric wiring according to the local wiring standard.

**Keep away from the unit when it is being carried with slings.**

- Forbidden

Never get close to the unit when it is being carried with slings. Failure to observe this instruction may result in fall or overturn of the unit, causing injury or property damage.

**Do not install a duct**

- Forbidden

If you install a duct at the exhaust port, the duct may fall.

**Do not climb on the OILCON (when it is packaged)**

- Forbidden

Do not climb on the OILCON when it is transported or installed. You may become trapped under the oil controller due to the package falling.

**Fasten the unit during operation.**

- Forbidden

Check the fastening points with the outline drawing, and fasten the unit securely with bolts or foundation bolts. Failure to observe this instruction may result in fall or overturn of the unit, if this unit is installed at an elevated position.
Precautions for use

**CAUTION**

**Prepare a circuit breaker at user’s site.**
- The Oil Cooling Unit is not equipped with a circuit breaker. A circuit breaker (3-pole) exclusively for the Oil Cooling Unit should be provided by user. (\(^*\))
- To ensure safety, it is recommended to use an earth leakage breaker. To use an earth leakage breaker, select an inverter-compatible type.
  - (Recommended: 15 mA or 20 mA)
- The distance between the contacts of the circuit breaker must be more than 3 mm.

**Check the oil piping.**
- Before or immediately after connection of the Oil Cooling Unit, make sure that the oil piping of the main machine is not blocked (fully closed). If the unit is operated with the oil piping blocked (fully closed), the oil hose may break due to an oil temperature rise, causing oil to flow out of the Oil Cooling Unit. When the oil temperature abnormally rises, the FH alarm is activated. In this case, stop operation of the main machine as soon as possible.

**Provide a flow switch for the main machine.**
- If the oil pump operation system has a fault, oil cannot be supplied to the main machine. Normally in this case, the Oil Cooling Unit detects the fault and outputs an alarm signal. However, it may not be detected depending on the fault mode. If the main machine must be protected even in such a case, provide a flow switch for the oil flow path of the main machine to watch the oil flow.

**Do not tilt the unit.**
- During transportation (including storage), do not tilt the Oil Cooling Unit more than 30°. If the unit is tilted more than 30°, the compressor may have a fault.

**Precautions for use**

**DANGER**

**Before handling this unit, turn OFF the power supply.**
- Before handling this unit, be sure to turn OFF the power supply.
- Handling this unit in live conditions may result in electric shock.
- To prevent erroneous powering while handling this unit, use this unit with the power box locked.

**Do not handle the unit for 5 minutes after power supply is turned OFF.**
- During this period, electric discharge from the internal high-voltage parts (capacitors) has not been completed. Failure to observe this instruction may result in electric shock.

**Do not operate the unit with the covers opened.**
- Do not operate the Oil Cooling Unit with the unit casing or terminal covers of the motor or other electric parts removed. Failure to observe this instruction may result in electric shock.

**Keep your hand or body away from the unit during operation.**
- During operation, the external casing may become extremely hot. Be careful that your hand or body does not directly touch it. Otherwise, you may get a burn.

**Observe the supervision and instructions of the safety manager**
- The appliance is not intended for use by persons (including children) with reduced physical, sensory or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction concerning use of the appliance by a person responsible for their safety.
- Children should be supervised to ensure that they do not play with the appliance.

**Do not use the unit beyond specified operating conditions.**
- Do not use this unit in any condition other than those specified in the catalog or delivery specifications. Failure to observe this instruction may result in a serious accident, such as damage to the main machine, injury, fire and electric shock.

**Do not use the unit in explosive atmosphere.**
- Do not install this unit in a place where evolution, inflow, retention or leak of inflammable gas may be expected, or where airborne carbon fiber is present. Failure to observe this instruction causes fire.

**Do not disassemble or repair the unit.**
- Do not modify this unit. Any person other than DAIKIN authorized service personnel must not disassemble or repair this unit. Failure to observe this instruction causes fire, electric shock or injury.
- If this unit is disassembled, repaired or modified by an unauthorized person, it shall not be beyond the scope of warranty.

**Do not splash water.**
- Do not immerse this unit in water, or splash water on the unit. Failure to observe this instruction may result in short-circuit or electric shock.
- Do not touch electric components with wet hands. Failure to observe this instruction may result in electric shock.
**WARNING**

If refrigerant leaks, provide thorough ventilation.
- Mandatory

If a large quantity of refrigerant is filled in the site, people in the site may be anesthetized or suffocated. With the CE model, MSDS (Material Safety Data Sheet) for the refrigerant is attached to the product. Take an action according to the MSDS.

Do not put a finger or foreign object in an aperture of the unit.
- Caution

To ensure safety, a cover or casing is mounted to rotary parts. Do not put a finger or foreign object in an aperture of the cover or casing. Failure to observe this instruction may result in injury.

Use a commercial power supply.
- Mandatory

Be sure to use a commercial power supply. Using an inverter power supply may result in burnout.

Do not step on the unit.
- Forbidden

Do not sit or step on this unit. Failure to observe this instruction may result in fall or overturn of the unit, causing injury. If the system is broken, the live parts may be exposed. Failure to observe this instruction may result in electric shock.

If an abnormal condition occurs, stop operation immediately.
- Mandatory

If an abnormal condition occurs, stop operation of the unit, and leave it unused until the cause of the trouble is securely removed. Failure to observe this instruction may result in damage to the unit, electric shock, fire or injury.

Turn OFF the circuit breaker.
- Mandatory

After stopping operation, be sure to turn OFF the circuit breaker.

When cleaning the unit, wear gloves.
- Mandatory

Otherwise, you may cut your hand with the condenser fin edges. Furthermore, the internal compressor or motor frames and the refrigerant piping become extremely hot. If you touch these parts with bare hands, you may get a burn.

CAUTION

Do not use the unit in special atmosphere.
- Forbidden

Do not use this unit in a special atmosphere including dust, oil mist or corrosive gas (H₂S, SO₂, NO₂, Cl₂, etc.), or at a high temperature or high humidity.

Do not put an obstacle near the air intake/exhaust port.
- Forbidden

Do not put an obstacle within 500 mm from the air intake/exhaust port. If air intake/exhaust flow is blocked, this unit may not provide the specified cooling capacity. Do not install a duct at the exhaust port.

Perform daily check for oil pollution.
- Mandatory

Oil pollution causes a fault or shortened service life of the pump. Use thorough caution about oil pollution to maintain the pollution degree at NAS10 or lower level.

Ensure safety of the main machine before trial run.
- Mandatory

Before executing a trial run, make sure that the main machine is set in safe conditions (the main machine will not run, or no accident occurs even if the main machine runs.) Failure to observe this instruction may result in injury or damage to the machine.

Clean the air filter periodically.
- Mandatory

Clean the air filter at least every two weeks. If the air filter is clogged, the cooling capacity deteriorates, and power consumption increases.

Cancel operation lock before running the main machine.
- Mandatory

Before you start running the main machine, cancel the operation lock status with the Oil Cooling Unit operation panel. If you start the main machine in the operation lock status, it cannot be supplied with oil, causing damage to the machine.

Do not run the pump without oil.
- Forbidden

Before start of operation, make sure that the oil pipe is properly connected, and the tank is filled with oil to an appropriate level. Running the pump without oil results in damage to the pump.

Check the unit before operation.
- Check

Before start of operation, make sure that the oil piping and electric wiring are properly conducted, and connecting parts are securely tightened.
Electrical Hazard
You may be seriously injured or killed because of an electric shock or fire. Do not open the cover of electric component box during the operation. Maintenance and inspection should be carried out by qualified personnel after the power supply is turned OFF.

Cut
When you carry out the maintenance work, wear gloves to prevent your hands from being cut by the heat exchanger.

Oil Cooling Unit and Accessories
* Some models do not come with accessories.

1 Oil Cooling Unit
Check the model name and serial No. (MFG. No.) on the nameplate attached to the right side of the Oil Cooling Unit.
* The attachment position of the nameplate (including the machine label) may be different for some models.

2 Accessories
An accessory package*1 is attached to the top plate of the Oil Cooling Unit.

Keep this manual in place where users can read it whenever required.

*1: Before operation, be sure to remove the accessory package. Otherwise, the package blocks exhaust air flow, resulting in cooling capacity deterioration.
Method of Transportation / Conveyance / Storage

- Precautions on transportation / conveyance / storage
  1. During transportation or conveyance, wear gloves and a helmet.
  2. Do not transport or convey the product by any method other than that specified below.
  3. For a product with a tank (-T), the unit may fall when transport or convey by hanging with the eye plate if the tank is filled with oil.
     Do not transport or convey the unit after installing the tank, which is prepared by the customer, by hanging the eye plate. The unit may fall.
  4. For the different-voltage model (-047, -048), carry out the transportation or conveyance using the hanger of transformer box.
     If you hang it using the eye plate, it may fall.
  5. Set the ambient storage temperature to 0 to 55°C (annual average 25°C) and set the ambient humidity to 95% (RH) or less (annual average is less than 75%).

- Carry out the transportation or conveyance according to the following method.

Stay away from the product during transportation or conveyance using the hanging tool.
Precautions for Installation

Installation place and oil piping

- To install this unit, select a place that meets the following conditions:
  1. Horizontal and rugged floor face (vertical interval 5 mm or less)
     When you install the product, fix it with a bolt (M10×20 hexagonal bolt is recommended).
  2. A place where the unit is not exposed to direct sunlight or heat
  3. A place with proper ventilation and little humidity
  4. A place where exhaust air does not circulate (exhaust air will not be taken into the unit)
  5. A place that allows easy access to piping and wiring
  6. A place with little contaminant, waste, dust particles or oil mist
     (Ensure that no foreign matter enters the electric component box.)
  7. A place free from explosive atmosphere (evolution, inflow, retention or leak of inflammable gas)
  8. Do not install the unit outdoors.
  9. Install the unit within 1 m of the tank level. (Otherwise, it will affect the sucking capability of the pump.)
 10. Keep any noise generating devices away from the unit. If it is difficult to do so, implement appropriate measures on the noise generating devices.
 11. Leave safe, sufficient space around the unit to ensure proper, trouble-free operations of the control panel.

- Do not place an object that may block air flow within 500 mm from the air intake/exhaust port.

- Oil piping: Locations of the oil inlet, oil outlet and oil drain are shown below.

Suction strainer (Line filter)

Attach a strainer (mesh size: 100 to 150) with a small pressure loss to the oil piping system.

- If the evaporator (cooler) in the Oil Cooling Unit is clogged with dust, it causes not only cooling capacity deterioration, but also a fault of the compressor or oil pump.
- During adjustment at trial run, the strainer gathers much dust from the oil piping system. Clean or replace the strainer before starting actual operation. Check the strainer periodically.
- The oil pollution level must not exceed NAS class 10.

Oil tank

- To receive oil from the main machine oil piping system, provide an oil tank that can accept an increase/decrease in oil quantity.
- Consider the tank structure so that inside of the tank can be easily cleaned. (For example, the tank has a cleaning hole or the tank top plate is detachable.)

Condition: ISO VG32, Viscosity: 200 mm\(^2\)/s

*1: The above pipe size may not be applied to the unit, depending on the pipe specifications. For details, contact DAIKIN.
*2: Refer to the pipe resistance calculation formula.

Pipe resistance calculation method

To determine the oil pipe size, calculate it based on the following formula:

\[ \Delta P = 0.595 \times V \times Q \times L/D^4 \]

(For general hydraulic oil/lubrication oil)

\( \Delta P \): Pipe resistance (MPa)
\( V \): Kinematic viscosity coefficient (mm\(^2\)/s)

.....See “Viscosity vs. Temperature” chart.

\( Q \): Flow rate (L/min)
\( L \): Pipe length (m)
\( D \): Pipe inner diameter (mm)

*For flow rate (Q), refer to “Oil pump discharge rate” in “Model Identification and Specifications” on page 13.

Example of viscosity (Kinematic viscosity coefficient)

(1) In winter: 195 mm\(^2\)/s (ISO VG32, Oil temperature: 5°C)
(2) In summer: 29 mm\(^2\)/s (ISO VG32, Oil temperature: 40°C)
Electric Wiring

- Conduct electric wiring according to the local wiring standard.
- For the power supply, be sure to use the commercial power source. If you use the inverter power source or other power source, the product may cause burnout.
- The Oil Cooling Unit (except for the “–B” model) is not equipped with a circuit breaker. A circuit breaker exclusively for the unit should be mounted to the main machine.
- For electric wiring, refer to the electric wiring diagram on the nameplate attached to the rear of the electrical equipment box cover.
- Do not change the wiring in the Oil Cooling Unit. Do not touch the protection devices.

Starting/stopping the Oil Cooling Unit

To turn ON the power supply for the Oil Cooling Unit, the following three methods are available:

1. **Directly starting/stopping the Oil Cooling Unit with the main machine power supply**
   When the circuit breaker for the main machine is turned ON, the Oil Cooling Unit starts operation. To stop the unit, turn OFF the circuit breaker for the main machine.

2. **Starting/stopping the Oil Cooling Unit with the remote control contact (see page 10)**
   When the remote control switch is turned ON, the Oil Cooling Unit starts operation. To stop the unit, turn OFF the remote control switch.

3. **Starting/stopping the Oil Cooling Unit with the control panel**
   If you keep pressing the < and ↑ keys for at least 5 seconds in the “operation lock” mode, the Oil Cooling Unit starts operation according to preset conditions. If you keep pressing the < and ↑ keys for at least 5 seconds during operation, “Loc” blinks on the data display, and the Oil Cooling Unit will be stopped (locked).
Mounting a circuit breaker

The Oil Cooling Unit is not equipped with a circuit breaker. Be sure to mount a 3-pole circuit breaker (*) exclusively for the Oil Cooling Unit to the main machine. For the breaker capacity, refer to the specifications of each model (see page 13).

To ensure safety, it is recommended to use an earth leakage breaker.

* The distance between the contacts of the circuit breaker must be more than 3 mm.

** CAUTION **

To use an earth leakage breaker, select an inverter-compatible type.

If the earth leakage breaker is not inverter-compatible, it may malfunction due to high-frequency noise of the inverter. (Recommended product: 15 mA or 20 mA)

Wiring procedure

1. Remove the top plate mounting screws, and remove the top plate.
2. Insert the power cable into the power cable insertion hole (φ28) in the side plate of the unit.

When using the different-voltage model (-047, -048), insert the power cable into the transformer box.

2. Insert the remote control signal cable and external output signal cable into the signal cable insertion hole (φ22) in the side plate of the unit.

When using the different-voltage model (-047, -048), insert the power cable into the transformer box.

* Use conduits with IP54 or higher for wiring intake to allow the electric component box to have a protective structure equivalent to IP54.

If the electric component box is affected by electrical noise, use conduits or shielded cables. Allow a proper distance from the potential noise source.

3. Connect the ground cable to the ground (ground) terminal.

Use green/yellow ground cable.

2. Connect the power cable to the power supply terminal block.

Connect the power cable to the breaker if OILCON is supplied with breaker.

When you remove the power cables, follow the instructions above in reverse. (Default setting is breaker OFF.)

The cable size should conform to those listed below, or a larger size.

<table>
<thead>

</tbody>
</table>

- For each wiring, use M4 (M5 for the terminal with a breaker) coated round crimp-style terminal. (For the crimp tool, use the specified tool. Carry out the processing of the crimp-style terminal to prevent short-circuits between phases.)
- The tightening torque of the screw to the terminal block should be 0.98 to 1.47N·m.
- Carry out the processing of the wiring carefully not to damage the electric wire coating.
- Fix the electric wire and the signal wire to the anchor mount with tie wrap. (See page 10)
- For remote control input connecting procedure, refer to page 10.
- For external output contact connecting procedure, refer to page 11.

4. Re-mount the top plate, and fasten it with the screws.

Secure the top plate attachment screw with 1N·m to maintain the protection structure of the electric component box.
### Outline of electrical equipment box (Typical)

**Connection of remote control input**

To execute remote control, connect the cable according to the procedure below.

1. **Local procurement items**

<table>
<thead>
<tr>
<th>Component</th>
<th>Wiring material</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single-pole, single-throw remote control switch, or “a” contact that enables operation command output</td>
<td>Single-core cable: φ1.2 (AWG16), or twisted cable: 1.25 mm² (AWG16), Bar-type crimp terminal (*)</td>
</tr>
</tbody>
</table>

   * Recommended Model (Manufacturer): TGN TC-1.25-9T (Nichifu)
   APA-1.25N (Daido Solderless Terminal Mfg.)

2. **Remove the short-circuit bar (between terminals [10] and [11]) on the terminal block in the electrical equipment box.**

   (For the crimp tool, use the specified tool.)

3. **Connect the cable specified in 1 above between terminals [10] and [11].**

   *12 VDC is applied across these terminals (Terminal [10]: negative polarity, [11]: positive polarity).
Connection of external output contact

To output the Oil Cooling Unit operation status signal to the main machine, connect the required signal cable to the signal terminal block according to the procedure below. For details of alarms, refer to “Alarm list” (page 33). For details of warnings, refer to “Warning list” (page 35).

To use an output contact, change the parameter setting, and make sure that the output contact normally operates. (For parameter setting changing procedure, refer to page 35.)

* Recommended Model (Manufacturer): TGN TC-1.25-9T (Nichifu) APA-1.25N (Daido Solderless Terminal Mfg.)

![External output circuit diagram](image)

(For alarm levels, refer to page 33.)

2. Connect each cable by using a bar-type crimp terminal.

3. Use a twisted cable.

4. When a 2-core IEC cable is used, the cable size should be 0.5 to 1.5 mm².

When you use a stripped wire, strip the sheath 9 to 10 mm from the end of the wire.

![CAUTION]

- The contact capacity is as follows:
  - Resistance load: 30 VDC, 2 A
- The minimum allowable load is as follows:
  - 10 µA, 10 mV
- To connect an inductive load, be sure to use a surge absorber.

#### Circuit voltage
- Main circuit: 3-phase 200/200, 220 VAC, 50/60 Hz
- Operation circuit: 200/200, 220 VAC, 50/60 Hz
- Transformer: 24/24, 24/24, 24/24, 24/24, 24/24, 24/24, 24/24
- Transformer: 0.44 kW, 0.49 kW, 0.5 kW, 0.6 kW

#### Max. power consumption
- 200 V 50 Hz: 0.90 kW/3.0 A
- 200 V 60 Hz: 0.90 kW/3.0 A

#### Max. current consumption
- 200 V 50 Hz: 0.90 kW/3.0 A
- 200 V 60 Hz: 0.90 kW/3.0 A

#### Transformer capacity
- Equivalent to 0.4 kW
- Equivalent to 0.75 kW
- Equivalent to 1.1 kW

#### Oil pump
- Discharge rate: 12/14.4
- Clamping pressure: 0.5
- Clamping pressure: 0.6

#### Temperature control
- Tuning type: Room temperature or machine temperature
- Tuning type: Inlet oil temperature or outlet oil temperature
- Tuning type: Inlet oil temperature or outlet oil temperature

#### Refrigerant
- New refrigerant: R410A
- Refrigerant control: Inverter compressor rotation speed + Electronic expansion valve opening

#### Refrigerant (New refrigerant: R410A)
- Loading weight: kg
- Loading weight: kg
- Loading weight: kg

#### Protection device
- Over-current relay (Pump motor), Reverse-phase protector, Restart prevention timer, Low room temperature protection thermostat, High oil temperature protection thermostat, Low oil temperature protection thermostat, Pump relief valve, Discharge pipe temperature thermostat, Condenser temperature thermostat, Refrigerant leak detector, Inverter protector, High pressure pressure switch (Cooler only), Compressor protection thermostat (Cooler only), Overheat protection temperature thermostat (Cooler only), Oil lack protection switch (Cooler only) No fuse breaker (Cooler only)

#### Operating range
- Room temperature: °C
- Oil inlet temperature: °C
- Oil outlet temperature: °C

#### Oil viscosity
- 5–50
- 5–50
- 5–50

#### External pressure loss
- Discharge: 0.5 MPa or less
- Suction: Within ±3.7 kPa

#### Applicable oil
- Lubrication oil, Mineral hydraulic oil (Phosphoric ester hydraulic oil, water/water-soluble liquid, chemical, food, fuel, cutting/grinding fluid cannot be used)

#### Connection pipe
- Oil inlet: Rc3/4
- Oil outlet: Rc3/4
- Oil drain: Rc1/4

#### Sound level
- Measurement (Measured at 1 m from front of unit, at 1 m height, in anechoic room): dB (A)
- 62 ±10
- 65 ±10

#### Transportation vibration resistance
- Vertical: 14.7 m/s² × 2.5 Hz (10 to 100 Hz sweep) mm
- 10
- 10

#### Weight
- Internal circuit breaker (Rated current): kg
- Oil tank (Volume): kg
- Local procurement item: kg

#### Model identification

**AKZ**

* Menu symbol (Note 1) or Numbering symbol
* Distinction symbol
* Nominal cooling capacity (Note 2)

![Model Identification](image)

(Notes)

1. Cooling capacity is the value at standard point (inlet oil temperature and room temperature: 35°C, ISO VG32 oil). The product tolerance is approx. ±5%.
2. Be sure to use a commercial power supply. Using an inverter power supply may result in burnout. Voltage fluctuation range should be within ±10%. If voltage fluctuation exceeds ±10%, consult DAIKIN.
3. For the different-voltage model, three types (046, 047 and 048) –047 and –048 is equipped with transformer. (–046 is without transformer. The outer dimension and weight is the same as standard model.)
4. The optional machine temperature tuning thermistor is required. (For details, see page [34])
5. The “–C” model is supplied with MSDS (Material Safety Data Sheet) for refrigerant R410A.
6. Electric unit protective structure: IP54 or equivalent (Use conduits higher than IP54 for the knock out hole)
7. Performance for transportation vibration refers to the performance of standard units.
8. No line breaker is included in this product. It must be separately provided by the customer.
9. The yellow line on the tank oil level gauge shows the highest oil level, and the red line shows the lowest oil level.
10. For energy-saving purposes, the rotation speed of a fan will vary according to the room temperature. This may change its noise level as well, but it does not constitute a failure.

(Compliant with ROHS)
Before Operation

Before operating the Oil Cooling Unit, check the following items:

1. Operating environment
   - Check the atmosphere for any factor (dust, oil mist, high temperature, high humidity, etc.) that may adversely affect the unit.
   - Check if the unit is not installed in explosive atmosphere (that may cause evolution, inflow, retention or leak of inflammable gas).
   - The operating range is limited. Make sure that the operating conditions are within the following range.
     (Note: If this unit is operated out of the specified range, the protection devices may be activated, or the service life may be shortened.)

2. Installation
   - Check if the unit has been securely fastened with bolts or foundation bolts.
   - Check for any obstacle that blocks air intake or exhaust flow.
     (Do not put an obstacle within 500 mm from the air intake/exhaust port.)

3. Oil piping
   - Check the oil piping for leak.
   - Check if an appropriate quantity of oil is filled in the tank. (Never run the pump without oil. Otherwise, the oil pump may be damaged.)
   - Check if the main machine oil piping is not blocked (fully closed). (If the unit is operated with the main machine oil piping blocked (fully closed), the oil temperature rises, causing an alarm.)
   - Check if the pressure loss is within the specified range. (Refer to "Precautions for Installation" on page 6.)
   - Check if the main machine oil piping is equipped with a flow switch.
     (To protect the main machine, it is recommended to mount a flow switch.)

4. Applicable oil
   - The Oil Cooling Unit is intended for lubrication oil and hydraulic oil (mineral oil). (Oils that belong to Class 3 petroleum and Class 4 petroleum among Class 4 dangerous substances prescribed by the Fire Service Law, and correspond to Discoloration No. 1 under “Petroleum Products—Corrosiveness to Copper—Copper Strip Test (JIS K2513)” and the pollution degree of NAS Class 10.)
     The following oils (liquids) cannot be used for this unit.
     1. Flame-resistant hydraulic oil (Phosphoric ester / chlorinated hydrocarbon / water + glycol / W/O, O/W emulsion type oils)
     2. Water and water-soluble liquids
     3. Chemical and food liquids
     4. Cutting oil (fluid) and grinding oil (fluid)
     5. Fuels (kerosene, gasoline, etc.)

5. Electric wiring
   - Check if the cable size is larger than the specified size. (Refer to "Wiring procedure" on page 9.)
   - Check if the ground cable is securely connected.
   - Be sure to use a commercial power supply. Using an inverter power supply may result in burnout.
   - Check if the power supply voltage is within the following range:
     50 Hz..............200 V ±10%
     60 Hz..............200/220 V ±10%
   - Check if a circuit breaker is provided exclusively for each Oil Cooling Unit.

6. For customers who use a model on which a pump is not mounted
   - For the pump prepared by a customer, it is recommended to observe the oil pump flow rate and the external pressure loss on the discharge side and suction side shown in the specification list on page of the instruction manual.
   - Connect the operation signal of the pump to the signal terminal block referencing the connection of the external output contact on page of the instruction manual.
   - For the power supply, be sure to observe the order of pump ON and OILCON ON.
   - Use the pump complying with the thermal relay setting the current value of the pump.

</tr>
</tbody>
</table>

\(^{\ast}1\): The operation modes marked with a circle can be used for normal operation.  
\(^{\ast}2\): “Parameter” means a constant to be defined for each setting.

Mode changing operation

Normally, the key is used to shift between individual modes. For special modes, you can change the mode by pressing several keys simultaneously for five seconds.

![Diagram of mode changing operation]

**CAUTION**

- The factory setting is the “Operation lock” mode. To start operation, cancel the operation lock mode. (See page 18.)
- With the standard model, the initial operating conditions are as follows: Operation mode: 3 (Room temperature tuning, Inlet oil temperature control) Temperature difference: 0.0 (K)
Handling

Before Operation

Checking Initial Operating Conditions

**Turn ON the power supply for the Oil Cooling Unit.**

Check the indication on the control panel.

**Is “U1” displayed on the control panel?**

YES

**Is the “Operation lock” mode selected?**

The DAIKIN factory setting is the “Operation lock” mode.

NO

YES

Cancel the operation lock mode.

If you keep pressing the ▼ and ▲ keys simultaneously for five seconds, the Oil Cooling Unit starts operation.

It means reverse-phase connection. Exchange two phases out of three phases (L1, L2 and L3).

Keep pressing these keys simultaneously for five seconds.

**Check the initial operating conditions.**

Check the current operation settings on the control panel display.

*1: You hear tick sound after power-ON, while the electronic expansion valve is under initial setup. This does not mean a fault.

*2: For initial setup of the electronic expansion valve and the microprocessor, the Oil Cooling Unit takes 90 seconds. After the initial setup, cooling operation starts (the compressor runs).

With the standard model, the factory setting of the operation mode is “3” (Room temperature tuning, Inlet oil temperature control), and the temperature difference is “0.0 (K)”. (With non-standard models, the factory settings may be different from the above.)

Example) Room temperature: 35˚C

(1) Operation mode display: Displays the operation mode.

(2) Data display: Displays the target temperature setting.

Changing operation settings

Holding constant oil temperature

</tr>
</tbody>
</table>

+1: For control target measuring points, see the figure below.
+2: Optional function using optional parts
+3: Operation modes 2, 7 and 8 cannot be used.
+4: K (Kelvin) is a symbol of the SI unit system that indicates a temperature difference (˚C).

System outline drawing

The oil cooling system of the Oil Cooling Unit is as shown below.

Description on the refrigerating cycle
A: The compressor produces high-temperature, high-pressure compressed gas so that the refrigerant gas can be easily cooled and liquefied in the condenser.
B: The condenser cools and condenses the high-temperature, high-pressure gas produced in the compressor, to transform it to high-temperature, high-pressure liquid.
C: The pressure reducing mechanism throttles the high-temperature, high-pressure liquid to reduce pressure, and transform it to low-temperature, low-pressure liquid/gas mixture so that it can be easily evaporated in the evaporator.
D: The evaporator evaporates the low-temperature, low-pressure liquid/gas mixture produced in the pressure reducing mechanism by absorbing heat from the oil (by cooling the oil), and transforms it to low-temperature, low-pressure gas.
E: Bypass mechanism controls the cooling capability under lower load by adjusting the flow rate of high temperature/high pressure gases to be distributed to the cooler.
Holding Constant Oil Temperature

To hold a constant oil temperature, the following two types of operation settings are available.

1. Select the operation setting mode.
   - Go to the operation setting mode with the key.
     See “Mode changing operation” on page 17.
   - The “SETTING” lamp on the operation mode indicator lights.
     * The number on the operation mode display blinks.

2. Change the operation mode.
   When the number on the operation mode display is blinking, change the number to “0” or “1” with the or key.

3. After changing the number, press the key to register it.
   After the number is registered, the number on the data display blinks.
   * The number on the operation mode display remains lit.

4. Change the temperature setting.
   When the number on the data display is blinking, change the set value to a desired oil temperature with the or key.

5. After changing the set value, press the key to register it.
   After the temperature setting is registered, the number on the operation mode display blinks.
   * The number on the data display remains lit.

6. Return to the normal mode.
   - Press the key three times, to return to the normal mode.
     See “Mode changing operation” on page 17.
   - The “NORMAL” lamp on the operation mode indicator lights.

* Optional function using optional parts. See page 35.

Setting procedure

1. Select the operation setting mode.
   - Go to the operation setting mode with the key.
     See “Mode changing operation” on page 17.
   - The “SETTING” lamp on the operation mode indicator lights.
     * The number on the operation mode display blinks.

2. Change the operation mode.
   When the number on the operation mode display is blinking, change the number to “0” or “1” with the or key.

3. After changing the number, press the key to register it.
   After the number is registered, the number on the data display blinks.
   * The number on the operation mode display remains lit.

4. Change the temperature setting.
   When the number on the data display is blinking, change the set value to a desired oil temperature with the or key.

5. After changing the set value, press the key to register it.
   After the temperature setting is registered, the number on the operation mode display blinks.
   * The number on the data display remains lit.

6. Return to the normal mode.
   - Press the key three times, to return to the normal mode.
     See “Mode changing operation” on page 17.
   - The “NORMAL” lamp on the operation mode indicator lights.
Tuning Oil Temperature to Room Temperature (or Machine Temperature)

To tune the oil temperature to the room temperature (or machine temperature), the following four types of operation settings are available.

- **Operation mode: 3**
  - Tuning the inlet oil temperature to the room temperature

- **Operation mode: 4**
  - Tuning the inlet oil temperature to the machine temperature

- **Operation mode: 5**
  - Tuning the outlet (returned) oil temperature to the room temperature

- **Operation mode: 6**
  - Tuning the outlet (returned) oil temperature to the machine temperature

* Optional function using optional parts. See page 17.

With the above operation settings, the Oil Cooling Unit controls the oil temperature so as to keep the difference between the room or machine temperature (reference temperature) and the oil temperature (control target) at a constant value as the user specified, according to a change in the room or machine temperature. The temperature difference setting range is –9.9 to +9.9 (K).

Setting procedure

1. **Select the operation setting mode.**
   - Go to the operation setting mode with the key.
   - See "Mode changing operation" on page 17.
   - The “SETTING” lamp on the operation mode indicator lights.
   - The number on the operation mode display blinks.

2. **Change the operation mode.**
   - When the number on the operation mode display is blinking, change the number to “3”, “4”, “5” or “6” with the or key.

3. **After changing the number, press the key to register it.**
   - After the number is registered, the number on the data display blinks.
   - The number on the operation mode display remains lit.

4. **Change the set value.**
   - When the number on the data display is blinking, change the set value to a desired temperature difference relative to the room (machine) temperature with the or key.

5. **After changing the set value, press the key to register it.**
   - After the temperature setting is registered, the number on the operation mode display blinks.
   - The number on the data display remains lit.

6. **Return to the normal mode.**
   - Press the key three times, to return to the normal mode.
   - See "Mode changing operation" on page 17.
   - The “NORMAL” lamp on the operation mode indicator lights.
Cooling Oil at Constant Capacity (%)

With the above operation setting, the Oil Cooling Unit executes cooling operation according to the specified capacity command (%). Oil temperature control is disabled.

The capacity setting range is 0 to 100%.
- The capacity (%) is an approximate index.
- When the capacity is set to 0%, the compressor stops. (The pump and fan are running.)
- Even if the capacity command value is same, the actual cooling capacity varies depending on the room temperature and the inlet oil temperature.

Caution
The oil temperature is not controlled in the operation mode: 9 and the main unit may be seriously damaged, use the product with extra care. For example, if the cooling capability insufficient status such as 0% operation is caused at the maximum load or the cooling capability excessive status like 100% operation is caused at low rotation, operating parts (such as the main shaft) may be damaged or burn out, or fire may be caused in the worst case.

Setting procedure

1. Select the operation setting mode.
   - Go to the operation setting mode with the key.
   - The “SETTING” lamp on the operation mode indicator lights.

2. Change the operation mode.
   - When the number on the operation mode display is blinking, change the number to “9” with the or key.

3. After changing the number, press the key to register it.
   - After the number is registered, the number on the data display blinks.

4. Change the set value.
   - When the number on the data display is blinking, change the set value to a desired capacity with the or key.

5. After changing the set value, press the key to register it.
   - After the temperature setting is registered, the number on the operation mode display blinks.

6. Return to the normal mode.
   - Press the key three times, to return to the normal mode.
   - The “NORMAL” lamp on the operation mode indicator lights.
Monitor Items

When the "Monitor mode" is selected, the following items can be checked.

<table>
<thead>
<tr>
<th>No.</th>
<th>Description</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Machine temperature [Th1]</td>
<td>-1</td>

<td>9</td>
<td>Status of expansion DIN (third digit)/DOUT (second digit)</td>
<td>-2</td>
</tr>
</tbody>
</table>

- **1**: Nos. 0, 1, 2, and 3 indicate a temperature detected with each thermistor.
  When the relevant thermistor is not connected or has a wire break, "–99.9" is displayed.
- **2**: With the factory setting, "O" is displayed. However, the indication will become valid when the parameter n020 is "1" or optional communication expansion board is installed.
- **3**: The outlined calculation value is set under the conditions; power supply voltage 200 V and pump discharge pressure: 0.2 MPa (VG32: oil temperature 25°C). (The error is approximately 20%.)
  For a machine without a pump, contact us separately.

Operating procedure

1. **Select the monitor mode.**
   - Go to the monitor mode with the \[\text{MODE} \downarrow\] key.
   - See “Mode changing operation” on page \[17\].
   - The “MONITOR” lamp on the operation mode indicator lights.
     - The value on the data number display blinks.

2. **Monitor the current status.**
   Change the value on the data number display to a desired value with the \[\text{DATA} \downarrow\] or \[\text{DATA} \uparrow\] key.

   When the data number is changed, the temperature currently detected with the thermistor and input/output values simultaneously appear on the data display.

3. **Return to the normal mode.**
   - Press the \[\text{MODE} \downarrow\] key two times, to return to the normal mode.
   - See “Mode changing operation” on page \[17\].
   - The “NORMAL” lamp on the operation mode indicator lights.
Timer Operation

With the “ON” timer, the Oil Cooling Unit can be started after elapse of a desired time. This mode can be used to warm up the main machine.

The operation start time setting range is 0 to 999 hours (in one hour steps).

* While the timer mode is selected, keep the main power supply ON.
  The value indicated on the control panel will be decremented from a preset value at one-hour intervals.
* To cancel the timer mode, set the timer at “0”.
* The timer setting is active only once. To use the timer again, you must set up the timer again.

Operating procedure

1. Select the timer mode.
   • Go to the timer mode with the key.
     See “Mode changing operation” on page 17.
   • The “TIMER SET” lamp on the operation mode indicator lights.
     * “0” blinks on the data display.

2. Specify an operation start time.
   Change the value on the data display to a desired value with the or key.
   The unit of set value is “h” (hour).

3. Set up the timer.
   • Press the key to register the timer setting.
   • When the timer is activated, the Oil Cooling Unit is halted.
     * The value on the data display blinks.
     * The “TIMER” lamp (red LED) blinks.
     Keep the main power supply ON.

Main machine warm-up

With the built-in heater model (–H), the electric heater heats up oil to a preset temperature during main machine warm-up in winter. Combining this function with timer operation enables more effective warm-up.

Heater ON: When inlet oil temperature is at least 0.5˚C lower than preset temperature
Heater OFF: When inlet oil temperature is equal to, or higher than preset temperature
Regardless of the operation mode, the Oil Cooling Unit turns ON/OFF the heater by detecting the inlet oil temperature.
(∗ Only when the compressor is not in operation)
Note that the heater cannot perform high-precision oil temperature control.
Additional Setting Functions

You can additionally set up the following functions by setting the parameters of the Oil Cooling Unit.

1 Additional setting functions

- **Auto-tuning**: Automatically sets up the parameters appropriately for the system. (See page 30.)
- **Temperature range warning**: Activates warning output when oil temperature exceeds preset temperature range. (See page 27.)
- **Alarm/warning output logic**: Outputs signal from Oil Cooling Unit to main machine. (See page 33.)
- **Communication with main machine**: Enables communication with main machine when optional board is mounted (see page 36). Refer to PIM00322.

2 Parameter list

The parameters that must be specified for individual additional setting functions are listed below:

<table>

- Warn: Use of parallel communication: Never attempt to change these settings. Otherwise, the unit may malfunction.
You can set the parameter that enables the additional setting functions of the Oil Cooling Unit.

For description of the additional setting functions and parameter list, refer to page 25.

**Setting procedure**

1. **Select the parameter setting mode.**
   - Go to the parameter setting mode by pressing the key for five seconds.
     See “Mode changing operation” on page 17.
   - The “SETTING” lamp on the operation mode indicator lights.
     * “P” blinks on the data number display.

2. **Select a parameter number.**
   - Change the parameter number to a desired number with the or key.
     * After the selected parameter number is displayed for approx. 0.5 seconds on the data display, the set value appears.

3. **Register the parameter number.**
   - Press the key to register the parameter number.
   - After the number is registered, the value on the data display blinks.
     * “P” on the data number display remains lit.

4. **Change the set value.**
   - When the value on the data display is blinking, change the set value with the or key.

5. **After changing the set value, press the key to register it.**
   - After the set value is registered, the value on the data display remains lit.
     * “P” blinks on the data number display.

6. **Return to the normal mode.**
   - Press the key, to return to the normal mode.
     See “Mode changing operation” on page 17.
   - The “NORMAL” lamp on the operation mode indicator lights.
Setting Additional Function—“Temperature range warning”

Outline of the function

- As an additional function of the Oil Cooling Unit, you can set up the “Temperature range warning” function. This function allows you to specify a desired temperature range within the Oil Cooling Unit operating range. When the control temperature exceeds the preset range, the unit informs you of the “Temperature range warning” condition.

- The “Temperature range warning” function provides the following settings:
  1) External output (30W relay output: ON or OFF): Turns ON/OFF the contact (66, 67) of the signal terminal block. (See the output logic on page 23.)
  2) Compressor forced stop—Warning: Stops the compressor. (Indication: 1E to 5E) Warning status will be automatically reset when preset warning reset temperature is reached.
  3) Alarm stop—“FH” alarm: Stops the compressor. (Indication: FH) (See “Alarm and warning output logic” on page 11.) The warning reset setting is inactive. (When the power supply is turned ON again, the compressor restarts operation.)

Parameter setting

To enable this function, set the corresponding parameters. You can specify up to five warning conditions with the following five groups of parameters.

<table>
<thead>
<tr>
<th>Types of temperature range warning</th>
<th>Parameter Group A</th>
<th>Parameter Group B</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Low oil temperature (Fixed temperature)</td>
<td>n010</td>
<td>n011</td>
</tr>
<tr>
<td>(2) High oil temperature (Fixed temperature)</td>
<td>n012</td>
<td>n013</td>
</tr>
<tr>
<td>(3) Low oil temperature (Temperature difference)</td>
<td>n014</td>
<td>n015</td>
</tr>
<tr>
<td>(4) High oil temperature (Temperature difference)</td>
<td>n016</td>
<td>n017</td>
</tr>
<tr>
<td>(5) Reserve</td>
<td>n018</td>
<td>n019</td>
</tr>
</tbody>
</table>

For temperature range warning, the above (1) to (5) types are available. Actually, however, any combinations of these types are enabled. The above (1) to (5) types can be simultaneously used.

Outlet oil temperature [Th2] or Inlet oil temperature [Th4]

- (1) When the outlet oil temperature [Th2] (or inlet oil temperature [Th4]) is 15°C or lower, the compressor stops. (Warning)
- (2) When the outlet oil temperature [Th2] (or inlet oil temperature [Th4]) is 35°C or higher, the compressor stops (FH alarm), and the 30W relay output turns ON or OFF.
- (3) When the outlet oil temperature [Th2] (or inlet oil temperature [Th4]) is at least 5°C lower than the room temperature [Th3] (or machine temperature [Th1]), the 30W relay output turns ON or OFF.
- (4) When the outlet oil temperature [Th2] (or inlet oil temperature [Th4]) is at least 5°C higher than the room temperature [Th3] (or machine temperature [Th1]), the 30W relay output turns ON or OFF.
Description on parameter settings (Group A)  

In this section, set the following parameters by using three digits (first, second and third digits) of each parameter on the control panel data display.

• “Temperature range warning condition setting” (Use the second and third digits.)
• “Temperature range warning operation setting” (Use the first digit.)

<table>
<thead>
<tr>

<td>n016 231</td>
<td></td>
</tr>
</tbody>
</table>

Note: Enter Group B (page 29) before Group A, so that the temperature range warning is not activated during setup.
Description on parameter settings (Group B)

In this section, set the following parameters by using three digits (first and second digits, and first decimal place) of each parameter on the control panel data display.

• “Temperature range warning temperature setting” (Use the first and second digits.)
• “Temperature range warning reset temperature setting” (Use the first decimal place. Active only when “Warning” has been set.)

<table>
<thead>
<tr>
<th>Temperature range warning temperature</th>
<th>Temperature range warning reset temperature (Temperature difference for automatic reset)</th>
</tr>
</thead>
<tbody>
<tr>

<td>(3) n015</td>
<td></td>
</tr>
<tr>
<td>(4) n017</td>
<td></td>
</tr>
</tbody>
</table>

*1: When the first digit of the “temperature range warning operation setting” parameter of Group A is “4” or “5”, this parameter is inactive because the warning status will not be automatically reset. (Enter any number from 0 to 9.)

**Example of parameter settings (for temperature range warning: See page 27.)**

- **(1)** When the outlet oil temperature [Th2] (or inlet oil temperature [Th4]) is 15˚C or lower, the compressor stops. (Warning) [When outlet oil temperature [Th2] becomes 17˚C, the warning status will be automatically reset.]
  - n011 15.2

- **(2)** When the outlet oil temperature [Th2] (or inlet oil temperature [Th4]) is 35˚C or higher, the compressor stops (FH alarm), and the 30W relay output turns ON or OFF.
  - n013 35.0

- **(3)** When the outlet oil temperature [Th2] (or inlet oil temperature [Th4]) is at least 5˚C lower than the room temperature [Th3] (or machine temperature [Th1]), the 30W relay output turns ON or OFF. [When the difference between room temperature [Th3] and outlet oil temperature [Th2] becomes 4˚C or less, the warning status will be automatically reset.]
  - n015 5.1

- **(4)** When the outlet oil temperature [Th2] (or inlet oil temperature [Th4]) is at least 5˚C higher than the room temperature [Th3] (or machine temperature [Th1]), the 30W relay output turns ON or OFF. [When the difference between room temperature [Th3] and outlet oil temperature [Th2] becomes 3˚C or less, the warning status will be automatically reset.]
  - n017 5.2

- **(2)** 17 (Temperature range warning reset temperature) – 15 (Temperature range warning temperature) = 2
- **(3)** 5 (Temperature range warning temperature) – 4 (Temperature range warning reset temperature) = 1
- **(4)** 5 (Temperature range warning temperature) – 3 (Temperature range warning reset temperature) = 2
For Temperature Control Improvement—“Auto-tuning mode”

* To use the Oil Cooling Unit in normal conditions, this function is not required.

Outline of the function
Depending on the system of the main machine, problems of “unstable temperature control” or “slow response in temperature control” may be raised. In such cases, it is possible that the temperature control gain P or I setting is not suitable for the system.

* Temperature control gain: Coefficient to determine a control value according to deviation (temperature difference)
  P: Proportional gain
  I: Integral gain

In such cases, you can improve the temperature control performance by using the “Auto-tuning mode” that provides more suitable gain settings.

Auto-tuning (Conceptual drawing)

The auto-tuning mode automatically writes calculated values of temperature control gain (P and I) into specified parameters.

<table>
<thead>
<tr>
<th>Parameter No.</th>
<th>Item</th>
</tr>
</thead>
<tbody>
<tr>
<td>n005</td>
<td>PI gain calculation coefficient (Response coefficient)</td>
</tr>
<tr>
<td>n006</td>
<td>Temperature control gain P (for low deviation)</td>
</tr>
<tr>
<td>n007</td>
<td>Temperature control gain I (for low deviation)</td>
</tr>
<tr>
<td>n008</td>
<td>Temperature control gain P (for high deviation)</td>
</tr>
<tr>
<td>n009</td>
<td>Temperature control gain I (for high deviation)</td>
</tr>
</tbody>
</table>

Outline of operation
The auto-tuning mode executes the following steps.
Check the Oil Cooling Unit status in each step.

<table>
<thead>
<tr>
<th>Step</th>
<th>Operation</th>

<td>Calculation of temperature control gain P and I from collected data, and writing gain into each parameter</td>
<td>Stop</td>
<td>+[Note] 5.</td>
</tr>
</tbody>
</table>
Operation flow

1. Starting auto-tuning
   - Original operation mode
   - Keep pressing these keys simultaneously for five seconds.

2. Step: 0 (Checking tuning conditions)
   - Normal (Original operation mode)

3. Step: 1 (Operation for stabilizing initial status)
   - Operation at 1% capacity
   - Normal

4. Step: 2 (Operation for collecting control target data)
   - Operation at 100% capacity
   - Normal

5. Step: 3 (Calculation of temperature control gain P and I from collected data, and writing gain into each parameter)
   - Operation at 0% capacity: Stop
   - Normal

6. Completion of auto-tuning
   - Operation at 0% capacity: Stop
   - Normal mode
Handling

Useful Functions

T: Deviation \( \left( ^\circ \text{C} \right) \)

T: Time \( n_{005} = 2.0 \)

(Initial value)

Small

Large

\( n_{005} \): Response coefficient

[Note]

1. When starting auto-tuning, make sure that the oil temperature is nearly equal to the room temperature (in stable condition). Leave the main machine under no load (stopped). To complete the auto tuning correctly, start the auto tuning after the power supply to OILCON is turned ON more than 5 minutes.

2. If the remote signal turns OFF or an alarm is activated during execution of auto-tuning, an error occurs (auto-tuning cannot be executed), and the corresponding error message appears.

To cancel the error, press the \( \text{Key} \). (The unit returns to the normal mode.)

Check the remote signal, or examine the cause of the alarm. After taking a corrective action, execute auto-tuning again.

3. Before starting auto-tuning, select an operation mode to determine the control target thermistor. (Select any operation mode other than “9”.)

   - Operation mode 0, 3 or 4 \( \Rightarrow \) Inlet oil temperature thermistor
   - Operation mode 1, 5 or 6 \( \Rightarrow \) Outlet oil temperature thermistor

   Then, set Parameter \( n_{004} \) by referring to [Note] 4. below.

4. In Step 2, the machine may be over-cooled. To suppress machine over-cooling, specify an auto-tuning end condition in Parameter \( n_{004} \).

   **Parameter \( n_{004} \) Outlet oil temperature decrease (Auto-tuning end condition)**
   Setting range: 0.0 to 10.0\(^\circ\text{C}\), Initial value: 8.0\(^\circ\text{C}\)

   When the outlet oil temperature decreases by the temperature specified in this parameter, auto-tuning (data collection) ends.

   If the specified temperature range is too small, temperature control gain may not be correctly calculated. You should set this parameter to the maximum value in the range where it does not cause damage to the machine.

5. To calculate more suitable temperature control gain based on the data collected in Step 3, you must specify a response coefficient in Parameter \( n_{005} \). (Through response coefficient adjustment, you can select whether to place importance on stability or response speed.)

   **Parameter \( n_{005} \) P and I gain calculation coefficient (Response coefficient)**
   Setting range: 0.1 to 10.0, Initial value: 2.0

   Setting a smaller value improves stability. Setting a larger value improves response speed.

6. Depending on the condition of the control target (machine), the unit may not calculate suitable temperature control gain in a single auto-tuning operation. You should execute auto-tuning two or three times to average the calculated values, or use the value that most frequently appears (except for an extreme value).

   To calculate a more suitable temperature control gain, you may change Parameter \( n_{005} \) (see [Note] 5. above).

7. The temperature control will not be stabilized when the load changes abruptly (transient period).
Alarm/Warning Output Logic

The Oil Cooling Unit can output an operation status signal to the main machine through wiring to the signal terminal block and parameter setup.

1. Connect the required signal cable to the signal terminal block.
   (For the connecting method, refer to “Connection of external output contact” on page 11.)

2. Set Parameter [n001].
   n001: Alarm/warning output logic (First digit).

### Setting

First digit: Specifies alarm output logic (60-61, 60-63) and warning output logic (66-67) of the signal terminal block.
Second digit: Specifies DOUT signal output logic. (Optional communication expansion board is required.)

Alarm Settings for Optional Protection Devices (Installed by User)

The Oil Cooling Unit can activate an alarm by receiving an output signal from optional protection devices (e.g. flow switch, level switch).

**When using OP terminals [12] and [13]:**

   (See “Outline of electrical equipment box” on page 10.)

2. Set Parameter [n002].
   *0*: OP terminal is not used. (Factory setting)
   *1*: When OP contact turns OFF, Alarm Level 1 is activated.
   *2*: When OP contact turns OFF, Alarm Level 2 is activated.
   *3*: When OP contact is not ON after 30 seconds from pump operation start, Alarm Level 1 is activated.

(CAUTION) The protection function cannot be activated simply by connecting the protection device to the OP terminals. Be sure to set this parameter.

**When using OP 2 terminal [CN2]:**

1. Connect the signal cable of the optional protection device to [CN2] on the Oil Cooling Unit control board.
   (See “Outline of electrical equipment box” on page 10.)

2. Set Parameter [n003].
   *0*: OP2 terminal is not used. (Factory setting)
   *1*: When OP2 contact turns OFF, Alarm Level 1 is activated.
   *2*: When OP2 contact turns OFF, Alarm Level 2 is activated.

(CAUTION) The protection function cannot be activated simply by connecting the protection device to the OP terminals. Be sure to set this parameter.
Optional Parts

Machine temperature tuning control

When the following optional parts are mounted to the main machine, the Oil Cooling Unit can perform control by detecting the machine temperature.

Optional Parts

Characteristics of thermistor: Resistance R25 (resistance at 25°C) = 20 kΩ, Tolerance: ±3% (Temperature equivalent: ±0.4°C)

Mounting procedure

**Oil Cooling Unit**

Connect the bar-type terminal plug [30] and [31] of the X2M terminal block in the electrical equipment box. (No polarity)
(See “Outline of electrical equipment box” on page 19.)

**Main machine**

For AKZ9–OP–K

![Connection to terminals 30 and 31 of Oil Cooling Unit X2M terminal block](chart)

Rc 1/8 (in machine body)
Prepared hole φ4, Depth: 20 min.

Fill silicone grease into hollow.
Recommended grease: Shin-Etsu Chemical Co., Ltd., Heat-radiating grease, Part No. KS609

**CAUTION**

- If the sensor is directly exposed to wind, detected temperature may fluctuate. Be sure to take heat-insulation measures by applying putty.
- When using a sensor of screw-mounting type, screw the sensor all the way into the body of the detection target.

For AKZ9–OP–A

![Connection to terminals 30 and 31 of Oil Cooling Unit X2M terminal block](chart)

Band and mounting screw shall be prepared by user.

Place the thermistor in contact with the machine body, and cover it with putty.
Optional Parts

Returned oil temperature control

When the following optional parts are mounted to the oil piping (return oil piping) of the main machine, the Oil Cooling Unit can perform control by detecting the returned oil temperature.

Optional parts

Characteristics of thermistor: Resistance R25 (resistance at 25°C) = 20 kΩ, Tolerance: ±3% (Temperature equivalent: ±0.4°C)

Mounting procedure

**Oil Cooling Unit**

Substitute the blue connector (XHP-3) of the above part for the blue connector [CN11] of the outlet oil temperature thermistor in the electrical equipment box. (See “Outline of electrical equipment box” on page 19.)

**Main machine**

For AKZ9-OP-Y

![Diagram](image-url)
### Optional Parts

#### Communication with main machine

When this optional board is mounted to the Oil Cooling Unit to connect this unit to the main machine:

1. **You can change the operation mode and operation setting from the main machine.**
2. **You can read the Oil Cooling Unit alarm code and temperature data (machine temperature, room temperature, inlet oil temperature, outlet oil temperature, temperature difference between inlet and outlet, and inverter frequency data) from the main machine.**

#### Optional parts

<table>
<thead>
<tr>
<th>Communication method</th>

</tr>
</tbody>
</table>

#### Mounting procedure

**AKZ9–OP–CS**

- **To main machine or PC**
  - Signal terminal block
  - Over-current Relay
  - Power supply terminal block
  - Connection to [CN12] on Oil Cooling Unit control board via supplied lead wire.

- **Connection to RS232C port of main machine or PC.** (D-SUB, 9-pin female connector)

- **Supplied lead wire**

- **Locking support (x4), Mounted to sheet metal**
Maintenance/Inspection

Daily maintenance/inspection

- Oil pollution causes a fault or shortened service life of the pump. Use thorough caution about oil pollution to maintain the pollution degree at NAS10 or lower level.
- Keep a normal oil level in the oil tank (Between the yellow line and red line of the oil level gauge). Make sure that the oil does not contain air bubbles.
- Clean inside of the oil tank periodically.
- Make sure that the main machine oil piping is not blocked (fully closed).
- Make sure that the oil piping has no oil leak.
- Make sure that the power supply voltage is within the following range:
  50 Hz...........200 V ±10%
  60 Hz...........200/220 V ±10%
- Make sure that the compressor, fan and oil pump do not abnormally sound during operation.
- Check whether the sheath of the OILCON power lead is not broken.

Periodic maintenance/inspection

Suction strainer
- Clean the suction strainer every six months to prevent the pump flow rate from being reduced by dust clogging, and to prevent abnormal sound caused by cavitation.

Air filter  (See page 15.)
NOTE: Wear gloves when working as the fins of the condenser may cause injury while replacing the air filter.
- Be sure to wash the air filter with water at 40˚C or lower temperature every two weeks. If the air filter is clogged with dust, the wind volume reduces, resulting in capacity deterioration. Also, the compressor’s protection device is activated, hindering smooth operation. Furthermore, it causes power consumption increase.
- Operating the unit without the air filter causes a fault.
- To remove the air filter, hold the bottom of the filter with both hands, and push it up while warping it forward.

Condenser  (See page 15.)
- Check whether there are any substances in the condenser by removing the air filter (You do not need to remove the external plate).
- If the condenser becomes extremely dirty, clean it with a brush, air blower, etc.
  (When cleaning the condenser fins, wear gloves. Otherwise, you may be injured by the sharp edges.)
- However, do not use water or cleaning agents for cleaning. The fan motor or pump motor may cause an earth leakage.

Exterior
- Wipe the exterior surface with a dry cloth.
  Never splash water over it.
- To clean the exterior, do not use a brush, polish powder, acid, solvent (benzine etc.) or hot water. Using such substances causes the paint to peel off.

Evaporator  (See page 37.)
- Perform periodical inspection as the oil piping becomes blocked (fully closed) because the oil-cooled coil is clogged with dirt. The inside of the evaporator cannot be checked as it is sealed. Check the oil level at the customer’s piping from the OILCON output (You do not need to remove the external plate).

Heater  (See page 15.)
- The dust clogging in the heater causes the same status as heating without water. Carry out the inspection periodically.

Oil drain  (See page 15.)
- Inspect the bottom of OILCON (drain pan) every six months and if the oil is accumulated, discharge it from the oil drain port. The tightening torque of the hexagonal bolt for the drain is 2N-m.
  If it is tightened with excessive torque, the bottom frame may be damaged.

Packing of the electric component box
- If the packing of the electric component box is seriously damaged, consult DAIKIN contact center. If you use the product without a change, the protection structure of IP54 cannot be maintained and the electric component may break down.

To leave the unit unused for a long period
- Mount a cover to the Oil Cooling Unit to prevent dust or water from entering inside of the unit.
- Be sure to turn OFF the main power supply.
- Be careful to keep oily dust off the condenser surface of the Oil Cooling Unit.
When the Oil Cooling Unit does not work well, first check the following points.

If the problem persists, contact DAIKIN Contact Center with information on the following 1), 2) and 3) items. (For phone/fax number and address of DAIKIN Contact Center, see the back cover.)

1) Machine name (Full Model No.)
2) Manufacture No. (MFG. No.)
3) Condition of the Oil Cooling Unit (as closely as possible)

NOTE: Customers should not perform any repairs as it is dangerous. Our service person will make repairs.

### When the unit operation seems abnormal although no alarm is activated

</table>
When a warning is activated
A warning is generated when the status of OILCON is not normal or the oil temperature to be monitored exceeds the setting temperature range.
If you continue operation without a change, OILCON may break down. Be sure to take measures.

EC DECLARATION OF INCORPORATION OF PARTLY COMPLETED MACHINERY

[01] DAIKIN INDUSTRIES, LTD
    1-1 Nishi-hitotsuya, Settsu-shi, Osaka, 566-8585, Japan

[02] Technical Documentation is obtained by the following authorized.
    Authorized representative  Sauer Bibus GmbH
    Address  Lise-Meitner-Ring 13, D-89231 Neu-Ulm, Germany

[03] Hereby declares that the machinery described below:
    Oil Cooling Unit AKZ 9 Series
    Models:  AKZ149-(B)C(H)(T), AKZ149-017,020,023,024,026,027,029,030
             AKZ329- (B)C(H)(T),  AKZ329-017,020,023,024,026,027,029,030
             AKZ439- (B)C(H)(T)  AKZ439-017,020,023,024,026,027,029,030

[04] This declaration complies with the provisions of the machinery directive and the regulations transposing it into national law, but the machinery described in this certificate must not be put into service until the machinery into which it is to be incorporated has been declared in conformity with the provisions of the Machinery and their amendments.
    Note) This declaration becomes invalid if technical or operational modifications are introduced without the manufacturer’s consent

[05] Also complies with the provisions of the following European Directives:
    - EMC Directive 2004/108/EC
      Relevant information that should be transmitted in response to a reasoned request by the national authorities, by the electronic method or other according to the request.

[06] Complies with the provisions of the following harmonised standard:
    - EMC Directive: EN 61000-6-4:2007
      EN 55011:2007+ A2:2007, (group 1, class A)
      EN 61000-6-2:2005

[08] Kenjiro Suzuki
    Quality Assurance Department Manager, Oil-hydraulic Division, Yodogawa Plant
